**UNITED STATES DISTRICT COURT  
DISTRICT OF NEW JERSEY**

ABBVIE INC. and GENENTECH, INC.,  
Plaintiffs,  
v.  
DR. REDDY'S LABORATORIES, INC.,  
Defendant.

**Civil Action No. \_\_\_\_\_**

**COMPLAINT FOR  
PATENT INFRINGEMENT**

**(Filed Electronically)**

Plaintiffs AbbVie Inc. (“AbbVie”) and Genentech, Inc. (“Genentech”) (collectively, “Plaintiffs”), by their undersigned attorneys, bring this action against Defendant Dr. Reddy’s Laboratories, Inc. (“DRLI” or “Defendant”) and hereby allege as follows:

**NATURE OF THE ACTION**

1. This action for patent infringement, brought pursuant to the patent laws of the United States, 35 U.S.C. §§ 1 *et seq.*, arises from DRLI’s submission to the United States Food and Drug Administration (“FDA”) of an Abbreviated New Drug Application (“ANDA”)

No. 214733 (“DRL’s ANDA”) seeking approval to market a generic version of Plaintiffs’ highly successful pharmaceutical product VENCLEXTA®, prior to the expiration of the patents listed in the *Approved Drug Products with Therapeutic Equivalence Evaluations* (an FDA publication commonly known as the “Orange Book”) for VENCLEXTA®. The Orange Book-listed patents are U.S. Patent Nos. 8,546,399 (“the ’399 Patent”), 9,174,982 (“the ’982 Patent”), 8,722,657 (“the ’657 Patent”), and 9,539,251 (“the ’251 Patent”). The ’399 Patent, the ’982 Patent, and the ’657 Patent are collectively referred to as “the Patents-in-suit.”

**PROCEEDING IN THE U.S. DISTRICT  
COURT FOR THE DISTRICT OF DELAWARE**

2. Plaintiffs filed a substantively similar suit on July 21, 2020 in the U.S. District Court for the District of Delaware (*AbbVie Inc., et al. v. Dr. Reddy’s Labs., Ltd., et al.*, Civil Action No. 20-968 (D. Del.)) against DRLI, along with DRLI’s parent, Dr. Reddy’s Laboratories, Ltd. (“DRLL”), an Indian company (DRLI and DRLL are collectively referred to as “DRL”), asserting infringement of the same three patents that are the subject of this suit (“the Delaware action”). The Delaware action is proceeding; service of the complaint, summons, and related papers has been initiated and Plaintiffs expect it to be completed by July 23, 2020.

3. On information and belief, the Court in the District of Delaware has jurisdiction over DRLI and venue is proper in that Judicial District, and, accordingly, the Delaware action should proceed. Out of an abundance of caution, however, Plaintiffs filed the instant suit in this Judicial District in the unlikely event that DRLI prevails in any challenge with respect to jurisdiction or venue in the Delaware action.

**VENCLEXTA®**

4. VENCLEXTA® (venetoclax) is a ground-breaking drug which has gained widespread acceptance in the medical community. It has been used to treat over 31,000 patients in the United States and around the world who suffer from chronic lymphocytic leukemia (“CLL”), small lymphocytic lymphoma (“SLL”), and, as part of a combination therapy, acute myeloid leukemia (“AML”).

5. VENCLEXTA® selectively targets and inhibits the B-cell CLL/lymphoma 2 (“BCL-2”) protein and is the first FDA-approved BCL-2 inhibitor. BCL-2 prevents apoptosis, or programmed cell death, which is the process for removal of aged or damaged cells.

6. VENCLEXTA® was first approved by the FDA on April 11, 2016 pursuant to New Drug Application (“NDA”) No. 208573. It is available as an oral tablet containing 10 mg, 50 mg, or 100 mg of venetoclax as the active pharmaceutical ingredient.

7. VENCLEXTA® is currently approved for use and indicated as follows: (1) for the treatment of adult patients with CLL or SLL; (2) in combination with azacitidine, or decitabine, or low-dose cytarabine for the treatment of newly-diagnosed AML in adults who are age 75 years or older, or who have comorbidities that preclude use of intensive induction chemotherapy.

8. AbbVie and Genentech co-market and sell VENCLEXTA® in the United States and other parts of the world. They have invested hundreds of millions of dollars to discover venetoclax and develop VENCLEXTA®, including investing significant resources investigating whether VENCLEXTA® alone and in combination with other drugs can treat other types of cancer.

9. The FDA has recognized the innovative nature of VENCLEXTA® in granting it five breakthrough therapy designations: (1) treatment of patients with relapsed or refractory CLL who harbor the 17p deletion mutation; (2) treatment of patients with relapsed or refractory CLL in combination with the anti-CD20 antibody rituximab (Rituxan®); (3) venetoclax in combination with hypomethylating agents for the treatment of patients with untreated (treatment-naïve) AML who are ineligible to receive standard induction therapy (high-dose chemotherapy); (4) combination of venetoclax and low-dose cytarabine for treatment-naïve patients with AML, who are ineligible for intensive chemotherapy; and (5) venetoclax in combination with obinutuzumab for the treatment of adult patients with CLL. A breakthrough designation is reserved for a drug intended to treat a serious condition where preliminary clinical results indicate that the drug may demonstrate substantial improvement over available therapies.

10. VENCLEXTA® has one of the most robust clinical oncology development programs for a single molecule in the industry, with approximately 195 ongoing clinical trials (including 15 Phase 3 trials).

11. In addition to being well-received by the FDA and the medical community, VENCLEXTA® received the biomedical industry's highest accolade in 2017 when it was awarded the Prix Galien Award for Best Pharmaceutical Product.

15. On information and belief, DRLI is a wholly owned subsidiary of DRLL, a company organized and existing under the laws of India.

18. On information and belief, and as described in DRL's written notification of DRL's ANDA and its accompanying § 505(j)(2)(A)(vii)(IV) certification received June 8, 2020 ("DRL's Notice Letter"), DRLI, acting in concert with or as an agent for DRLL, caused DRL's ANDA to be submitted to the FDA and seek FDA approval of DRL's ANDA prior to the expiration of the patents listed in the Orange Book for VENCLEXTA®.

19. On information and belief, DRLI, acting in concert with or as an agent for DRLL, intends to commercially manufacture, market, offer for sale, and sell the proposed generic venetoclax tablets described in DRL's ANDA ("DRL's Generic Version") throughout the United States, including in the State of New Jersey, in the event the FDA approves DRL's ANDA.

**JURISDICTION & VENUE**

20. This civil action for patent infringement arises under the Patent Laws of the United States and the Food and Drug Laws of the United States, Titles 35 and 21, United States Code.

21. This Court has jurisdiction over the subject matter of this action pursuant to 28 U.S.C. §§ 1331 and 1338(a).

22. This Court has personal jurisdiction over DRLI by virtue of, *inter alia*, on information and belief, DRLI having availed itself of the rights and benefits of the laws of the State of New Jersey by engaging in substantial, continuous, and systematic contacts with the State of New Jersey and because DRLI intends to indirectly or directly market, sell, and/or distribute generic drugs to residents of this State, including DRL's Generic Version. Accordingly, DRLI should reasonably anticipate being hauled into court in this Judicial District.

23. On information and belief, Defendant, acting in concert with and/or as an agent for DRLL, filed DRL's ANDA.

24. On information and belief, DRLI, acting in concert with and/or as an agent for DRLL, will market, distribute, and/or sell DRL's Generic Version in the United States, including in New Jersey, upon approval of DRL's ANDA, and will derive substantial revenue from the sale of DRL's Generic Version.

25. On information and belief, DRL's Generic Version will be used within and throughout the United States, including in New Jersey.

26. On information and belief, DRL's Generic Version will be prescribed by physicians practicing in New Jersey, dispensed by pharmacies located within New Jersey, and used by patients in New Jersey.

27. This Court also has personal jurisdiction over Defendant by virtue of, *inter alia*, the fact that it has committed, aided, abetted, contributed to, and/or participated in the commission of a tortious act of patent infringement under 35 U.S.C. § 271(e)(2) that has led to and/or will lead to foreseeable harm and injury to Plaintiffs in New Jersey.

28. This Court also has personal jurisdiction over DRLI because, *inter alia*, DRLI, on information and belief, is registered as a manufacturer and wholesaler in New Jersey under license No. 5002312 and as a business operating in New Jersey under Business ID. No. 0100518911.

29. Venue is proper in this Judicial District for DRLI pursuant to 28 U.S.C. § 1400(b) because, on information and belief, *inter alia*, DRLI was incorporated in the State of New Jersey, DRLI has a regular and established place of business in the State of New Jersey, and DRL's Generic Version will be prescribed by physicians practicing in New Jersey, dispensed by pharmacies located within New Jersey, and used by patients in New Jersey. Each of these activities would have a substantial effect within New Jersey and would constitute an act of infringement of the Patents-in-suit if DRL's Generic Version is approved before the Patents-in-suit expire.

#### **THE ASSERTED PATENTS**

30. The '399 patent, titled "Apoptosis Inducing Agents for the Treatment of Cancer and Immune and Autoimmune Diseases," was duly and legally issued by the United

31. The ’399 patent is assigned to AbbVie, Genentech, and the Walter and Eliza Hall Institute of Medical Research.

32. The ’982 patent, titled “Apoptosis-Inducing Agents for the Treatment of Cancer and Immune and Autoimmune Diseases,” was duly and legally issued by the USPTO on November 3, 2015. A true and correct copy of the ’982 patent is attached as Exhibit B.

33. The ’982 patent is assigned to AbbVie, Genentech, and the Walter and Eliza Hall Institute of Medical Research.

34. The ’657 patent, titled “Salts and Crystalline Forms of an Apoptosis-Inducing Agent,” was duly and legally issued by the USPTO on May 13, 2014. A true and correct copy of the ’657 patent is attached as Exhibit C.

35. The ’657 patent is assigned to AbbVie and exclusively licensed to Genentech.

#### **DRL’S ANDA**

36. On information and belief, DRL’s Notice Letter represents that DR LI, on behalf of DR LL, submitted and continues to maintain DRL’s ANDA to the FDA under 21 U.S.C. § 355(j).

37. On information and belief, and based on DRL’s Notice Letter, DR LI has submitted DRL’s ANDA to the FDA in order to obtain approval to engage in the commercial manufacture, use, or sale of venetoclax tablets as a purported generic version of VENCLEXTA® prior to the expiration of the Patents-in-suit and the ’251 Patent.

38. On information and belief, the FDA has not approved DRL’s ANDA.

39. DRL's Notice Letter states that "DRL seeks to obtain approval to engage in the commercial manufacture, use, or sale of" "venetoclax tablets, 10 mg, 50 mg, 100 mg." DRL's Notice Letter also states that "[t]he active ingredient present in [DRL's Generic Version] is 4-(4-{[2-(4-chlorophenyl)-4,4-dimethylcyclohex-1-en-1-yl]methyl}piperazin-1-yl)-N-({3-nitro-4-[(tetrahydro-2H-pyran-4-ylmethyl)amino]phenyl}sulfonyl)-2-(1*H*-pyrrolo[2,3-*b*]pyridin-5-yloxy)benzamide), commonly known as venetoclax."

40. VENCLEXTA®'s Prescribing Information ("VENCLEXTA® PI") states that "VENCLEXTA® tablets for oral administration . . . contain 10, 50, or 100 mg venetoclax as the active ingredient" and "[v]enetoclax is described chemically as 4-(4-{[2-(4-chlorophenyl)-4,4-dimethylcyclohex-1-en-1-yl]methyl}piperazin-1-yl)-N-({3-nitro-4-[(tetrahydro-2*H*-pyran-4-ylmethyl)amino]phenyl}sulfonyl)-2-(1*H*-pyrrolo[2,3-*b*]pyridin-5-yloxy)benzamide.)"

41. On information and belief, and as supported by DRL's Notice Letter, by filing DRL's ANDA, DRLI has certified to the FDA that DRL's Generic Version has the same active pharmaceutical ingredient as VENCLEXTA® and either the same or similar proposed labeling as VENCLEXTA®.

42. DRL's Notice Letter represents that DRLI certified in DRL's ANDA that the claims of the Patents-in-suit are invalid or would not be infringed by the commercial manufacture, use, sale, or offer for sale of DRL's Generic Version.

43. According to applicable regulations, Notice Letters such as DRL's Notice Letter must contain a detailed statement of the factual and legal bases for the applicant's opinion that the patent is invalid, unenforceable, or not infringed, which includes a claim-by-claim analysis, describing "[f]or each claim of a patent alleged not to be infringed, a full and detailed explanation of why the claim is not infringed" and "[f]or each claim of a patent alleged to be

invalid or unenforceable, a full and detailed explanation of the grounds supporting the allegation.” *See* 21 C.F.R. § 314.95(c)(7); *see also* 21 C.F.R. § 314.52.

44. For at least one claim of each of the ’399 and ’982 Patents, DRL’s Notice Letter failed to allege that DRL’s Generic Version or the proposed administration of DRL’s Generic Version would not meet the limitations of that claim.

45. DRL’s Notice Letter also fails to address the ’251 Patent, which is listed in the Orange Book for VENCLEXTA®.

46. DRL’s Notice Letter contained an Offer of Confidential Access (“OCA”) to certain confidential information regarding DRL’s Generic Version. Plaintiffs and DRLI subsequently exchanged proposed revisions to the draft OCA in an attempt to reach agreement on the terms for confidential access, but DRLI refused Plaintiffs’ reasonable requests, including requests for samples of DRL’s Generic Version and active pharmaceutical ingredient. Thus, as of the filing of this Complaint, the parties have not been able to reach an agreement.

47. To date, DRLI has not provided Plaintiffs with any portion of DRL’s ANDA nor any information regarding DRL’s Generic Version, beyond the information in DRL’s Notice Letter.

48. To date, DRLI has not provided Plaintiffs with samples of DRL’s Generic Version embodied by DRL’s ANDA or the active pharmaceutical ingredient.

49. The limited information relating to DRL’s Generic Version that was provided in DRL’s Notice Letter does not demonstrate that DRL’s Generic Version, which DRLI has asked the FDA to approve for sale in the U.S., will not fall within the scope of claims of the Patents-in-suit.

50. This action is being brought within 45 days of Plaintiffs' receipt on June 8, 2020 of DRL's Notice Letter, pursuant to 21 U.S.C. § 355(c)(3)(C). Accordingly, Plaintiffs are entitled to a stay of FDA approval pursuant to 21 U.S.C. § 355(j)(5)(B)(iii) and U.S.C. § 355(j)(5)(F)(ii).

**CLAIM FOR RELIEF**  
**COUNT 1: INFRINGEMENT OF THE '399 PATENT BY DRLI**

51. Plaintiffs restate, re-allege, and incorporate by reference paragraphs 1-50 as if fully set forth herein.

52. On information and belief, DRLI submitted or caused the submission of DRL's ANDA to the FDA, and thereby seeks FDA approval of DRL's Generic Version.

53. DRL's Generic Version infringes one or more claims of the '399 Patent.

54. DRLI did not contest infringement of any claim of the '399 Patent in DRL's Notice Letter. If DRLI had a factual or legal basis to contest infringement of the '399 Patent, it was required by applicable regulations to state such a basis in its Notice Letter. *See* 21 C.F.R. § 314.95(c)(7); *see also* 21 C.F.R. § 314.52.

55. DRLI has infringed one or more claims of the '399 Patent under 35 U.S.C. § 271(e)(2)(A) by submitting DRL's ANDA with Paragraph IV certification and thereby seeking FDA approval of a generic version of VENCLEXTA®, prior to the expiration of the '399 Patent.

56. On information and belief, the importation, manufacture, sale, offer for sale, or use of DRL's Generic Version prior to the expiration of the '399 Patent would infringe one or more claims of the '399 Patent under 35 U.S.C. § 271(a), and/or DRLI would induce or contribute to the inducement of the infringement of one or more claims of the '399 Patent under 35 USC § 271(b) and/or (c).

57. DRLI had actual and constructive notice of the '399 Patent prior to filing DRL's ANDA, and was aware that the filing of DRL's ANDA with the request for FDA approval prior to the expiration of the '399 Patent would constitute an act of infringement of the '399 Patent.

58. DRLI filed its ANDA without adequate justification for asserting that the '399 Patent is invalid, unenforceable, and/or not infringed by the commercial manufacture, use, offer for sale, or sale of DRL's Generic Version.

59. Plaintiffs will be irreparably harmed if DRLI is not enjoined from infringing, and from actively inducing or contributing to the infringement of, the '399 Patent. Plaintiffs do not have an adequate remedy at law and, considering the balance of hardships between Plaintiffs and DRLI, a remedy in equity is warranted. Further, the public interest would not be disserved by the entry of a permanent injunction.

**CLAIM FOR RELIEF**  
**COUNT 2: INFRINGEMENT OF THE '982 PATENT BY DRLI**

60. Plaintiffs restate, re-allege, and incorporate by reference paragraphs 1-59 as if fully set forth herein.

61. On information and belief, DRLI submitted or caused the submission of DRL's ANDA to the FDA, and thereby seeks FDA approval of DRL's Generic Version.

62. DRL's Generic Version infringes one or more claims of the '982 Patent.

63. DRLI did not contest infringement of any claim of the '982 Patent in DRL's Notice Letter. If DRLI had a factual or legal basis to contest infringement of the '982 Patent, it was required by applicable regulations to state such a basis in its Notice Letter. *See* 21 C.F.R. § 314.95(c)(7); *see also* 21 C.F.R. § 314.52.

64. DRLI has infringed one or more claims of the '982 Patent under 35 U.S.C. § 271(e)(2)(A) by submitting DRL's ANDA with Paragraph IV certification and thereby seeking FDA approval of a generic version of VENCLEXTA®, prior to the expiration of the '982 Patent.

65. On information and belief, the importation, manufacture, sale, offer for sale, or use of DRL's Generic Version prior to the expiration of the '982 Patent would infringe one or more claims of the '982 Patent under 35 U.S.C. § 271(a), and/or DRLI would induce or contribute to the inducement of the infringement of one or more claims of the '982 Patent under 35 USC § 271(b) and/or (c).

66. DRLI had actual and constructive notice of the '982 Patent prior to filing DRL's ANDA, and was aware that the filing of DRL's ANDA with the request for FDA approval prior to the expiration of the '982 Patent would constitute an act of infringement of the '982 Patent.

67. DRLI filed its ANDA without adequate justification for asserting that the '982 Patent is invalid, unenforceable, and/or not infringed by the commercial manufacture, use, offer for sale, or sale of DRL's Generic Version.

68. Plaintiffs will be irreparably harmed if DRLI is not enjoined from infringing, and from actively inducing or contributing to the infringement of, the '982 Patent. Plaintiffs do not have an adequate remedy at law and, considering the balance of hardships between Plaintiffs and DRLI, a remedy in equity is warranted. Further, the public interest would not be disserved by the entry of a permanent injunction.

**CLAIM FOR RELIEF**  
**COUNT 3: INFRINGEMENT OF THE '657 PATENT BY DRLI**

69. Plaintiffs restate, re-allege, and incorporate by reference paragraphs 1-68 as if fully set forth herein.

70. On information and belief, DRLI submitted or caused the submission of DRL's ANDA to the FDA, and thereby seeks FDA approval of DRL's Generic Version.

71. On information and belief, DRL's Generic Version infringes one or more claims of the '657 Patent.

72. DRLI has infringed one or more claims of the '657 Patent under 35 U.S.C. § 271(e)(2)(A) by submitting DRL's ANDA with Paragraph IV certification and thereby seeking FDA approval of a generic version of VENCLEXTA®, prior to the expiration of the '657 Patent.

73. On information and belief, the importation, manufacture, sale, offer for sale, or use of DRL's Generic Version prior to the expiration of the '657 Patent would infringe one or more claims of the '657 Patent under 35 U.S.C. § 271(a), and/or DRLI would induce or contribute to the inducement of the infringement of one or more claims of the '657 Patent under 35 USC § 271(b) and/or (c).

74. DRLI had actual and constructive notice of the '657 Patent prior to filing DRL's ANDA, and was aware that the filing of DRL's ANDA with the request for FDA approval prior to the expiration of the '657 Patent would constitute an act of infringement of the '657 Patent.

75. DRLI filed its ANDA without adequate justification for asserting that the '657 Patent is invalid, unenforceable, and/or not infringed by the commercial manufacture, use, offer for sale, or sale of DRL's Generic Version.

76. Plaintiffs will be irreparably harmed if DRLI is not enjoined from infringing, and from actively inducing or contributing to the infringement of, the '657 Patent. Plaintiffs do not have an adequate remedy at law and, considering the balance of hardships

between Plaintiffs and DRLI, a remedy in equity is warranted. Further, the public interest would not be disserved by the entry of a permanent injunction.

**APOPTOSIS INDUCING AGENTS FOR THE TREATMENT OF CANCER AND IMMUNE AND AUTOIMMUNE DISEASES**

This application claims priority to U.S. Provisional Application Ser. No. 61/181,203 filed May 26, 2009, which is incorporated by reference in its entirety.

**FIELD OF THE INVENTION**

This invention pertains to compounds which inhibit the activity of Bcl-2 anti-apoptotic proteins, compositions containing the compounds, and methods of treating diseases during which anti-apoptotic Bcl-2 proteins are expressed.

**BACKGROUND OF THE INVENTION**

Anti-apoptotic Bcl-2 proteins are associated with a number of diseases. There is therefore an existing need in the therapeutic arts for compounds which inhibit the activity of anti-apoptotic Bcl-2 proteins.

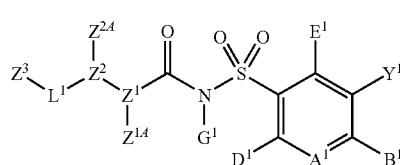

Overexpression of Bcl-2 proteins correlates with resistance to chemotherapy, clinical outcome, disease progression, overall prognosis or a combination thereof in various cancers and disorders of the immune system.

Involvement of Bcl-2 proteins in bladder cancer, brain cancer, breast cancer, bone marrow cancer, cervical cancer, chronic lymphocytic leukemia, colorectal cancer, esophageal cancer, hepatocellular cancer, lymphoblastic leukemia, follicular lymphoma, lymphoid malignancies of T-cell or B-cell origin, melanoma, myelogenous leukemia, myeloma, oral cancer, ovarian cancer, non-small cell lung cancer, prostate cancer, small cell lung cancer, spleen cancer, and the like is described in commonly-owned PCT US 2004/36770, published as WO 2005/049593, and PCT US 2004/37911, published as WO 2005/024636.

Involvement of Bcl-2 proteins in immune and autoimmune diseases is described in *Current Allergy and Asthma Reports* 2003, 3, 378-384; *British Journal of Haematology* 2000, 110 (3), 584-90; *Blood* 2000, 95(4), 1283-92; and *New England Journal of Medicine* 2004, 351(14), 1409-1418. Involvement of Bcl-2 proteins in arthritis is disclosed in commonly-owned U.S. Provisional Patent Application Ser. No. 60/988,479. Involvement of Bcl-2 proteins in bone marrow transplant rejection is disclosed in commonly-owned U.S. patent application Ser. No. 11/941,196.

**SUMMARY OF THE INVENTION**

One embodiment of this invention, therefore, pertains to compounds or therapeutically acceptable salts, which are useful as inhibitors of anti-apoptotic Bcl-2 proteins, the compounds having Formula (I)

Compounds

Geometric isomers may exist in the present compounds. Compounds of this invention may contain carbon-carbon double bonds or carbon-nitrogen double bonds in the E or Z configuration, wherein the term “E” represents higher order substituents on opposite sides of the carbon-carbon or car-

bon-nitrogen double bond and the term "Z" represents higher order substituents on the same side of the carbon-carbon or carbon-nitrogen double bond as determined by the Cahn-Ingold-Prelog Priority Rules. The compounds of this invention may also exist as a mixture of "E" and "Z" isomers. Substituents around a cycloalkyl or heterocycloalkyl are designated as being of cis or trans configuration. Furthermore, the invention contemplates the various isomers and mixtures thereof resulting from the disposal of substituents around an adamantine ring system. Two substituents around a single ring within an adamantine ring system are designated as being of Z or E relative configuration. For examples, see C. D. Jones, M. Kasej, R. N. Salvatore, W. J. le Noble *J. Org. Chem.* 1998, 63, 2758-2760.

Compounds of this invention may contain asymmetrically substituted carbon atoms in the R or S configuration, in which the terms "R" and "S" are as defined by the IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem. (1976) 45, 13-10. Compounds having asymmetrically substituted carbon atoms with equal amounts of R and S configurations are racemic at those carbon atoms. Atoms with an excess of one configuration over the other are assigned the configuration present in the higher amount, preferably an excess of about 85%-90%, more preferably an excess of about 95%-99%, and still more preferably an excess greater than about 99%. Accordingly, this invention includes racemic mixtures, relative and absolute stereoisomers, and mixtures of relative and absolute stereoisomers.

In another embodiment, the isotope-labeled compounds contain deuterium ( $^2\text{H}$ ), tritium ( $^3\text{H}$ ) or  $^{14}\text{C}$  isotopes. Isotope-labeled compounds of this invention can be prepared by the general methods well known to persons having ordinary skill in the art. Such isotope-labeled compounds can be conveniently prepared by carrying out the procedures disclosed in the Examples disclosed herein and Schemes by substituting a readily available isotope-labeled reagent for a non-labeled reagent. In some instances, compounds may be treated with isotope-labeled reagents to exchange a normal atom with its isotope, for example, hydrogen for deuterium can be exchanged by the action of a deuterium acid such as  $\text{D}_2\text{SO}_4/\text{D}_2\text{O}$ . In addition to the above, relevant procedures and intermediates are disclosed, for instance, in Lizondo, J et al., *Drugs Fut.* 21(11), 1116 (1996); Brickner, S J et al., *J Med Chem.* 39(3), 673 (1996); Mallesham, B et al., *Org Lett*, 5(7), 963 (2003); PCT publications WO1997010223, WO2005099353, WO1995007271, WO2006008754; U.S. Pat. have been used in pharmaceutical research to investigate the in vivo metabolic fate of the compounds by evaluation of the mechanism of action and metabolic pathway of the nonisotope-labeled parent compound (Blake et al. *J. Pharm. Sci.* 64, 3, 367-391 (1975)). Such metabolic studies are important in the design of safe, effective therapeutic drugs, either because the in vivo active compound administered to the patient or because the metabolites produced from the parent compound prove to be toxic or carcinogenic (Foster et al., *Advances in Drug Research Vol. 14*, pp. 2-36, Academic press, London, 1985; Kato et al., *J. Labelled Comp. Radiopharmaceut.*, 36(10):927-932 (1995); Kushner et al., *Can. J. Physiol. Pharmacol.*, 77, 79-88 (1999).

In addition, non-radio active isotope containing drugs, such as deuterated drugs called "heavy drugs," can be used for the treatment of diseases and conditions related to Bcl-2 activity. Increasing the amount of an isotope present in a compound above its natural abundance is called enrichment. Examples of the amount of enrichment include from about 0.5, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 16, 21, 25, 29, 33, 37, 42, 46, 50, 54, 58, 63, 67, 71, 75, 79, 84, 88, 92, 96, to about 100 mol %. Replacement of up to about 15% of normal atom with a heavy isotope has been effected and maintained for a period of days to weeks in mammals, including rodents and dogs, with minimal observed adverse effects (Czajka D M and Finkel A J, *Ann. N.Y. Acad. Sci.* 1960 84: 770; Thomson J F, *Ann. New York Acad. Sci.* 1960 84: 736; Czakja D M et al., *Am. J. Physiol.* 1961 201: 357). Acute replacement of as high as 15%-23% in human fluids with deuterium was found not to cause toxicity (Blagojevic N et al. in "Dosimetry & Treatment Planning for Neutron Capture Therapy", Zamenhof R, Solares G and Harling O Eds. 1994. Advanced Medical Publishing, Madison Wis. pp. 125-134; *Diabetes Metab.* 23: 251 (1997)).

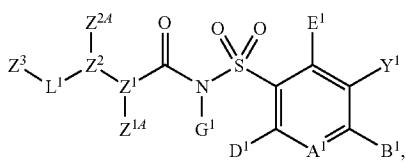

Stable isotope labeling of a drug can alter its physicochemical properties such as pKa and lipid solubility. These effects and alterations can affect the pharmacodynamic response of the drug molecule if the isotopic substitution affects a region involved in a ligand-receptor interaction. While some of the physical properties of a stable isotope-labeled molecule are different from those of the unlabeled one, the chemical and biological properties are the same, with one important exception: because of the increased mass of the heavy isotope, any bond involving the heavy isotope and another atom will be stronger than the same bond between the light isotope and that atom. Accordingly, the incorporation of an isotope at a site of metabolism or enzymatic transformation will slow said reactions potentially altering the pharmacokinetic profile or efficacy relative to the non-isotopic compound.

Suitable groups for  $A^1, B^1, D^1, E^1, G^1, Y^1, L^1, Z^{14}, Z^{24}, Z^1, Z^2$ , and  $Z^3$  in compounds of Formula (I) are independently selected. The described embodiments of the present invention may be combined. Such combination is contemplated and within the scope of the present invention. For example, it is contemplated that embodiments for any of  $A^1, B^1, D^1, E^1, G^1, Y^1, L^1, Z^{14}, Z^{24}, Z^1, Z^2$ , and  $Z^3$  can be combined with embodiments defined for any other of  $A^1, B^1, D^1, E^1, G^1, Y^1, L^1, Z^{14}, Z^{24}, Z^1, Z^2$ , and  $Z^3$ .

One embodiment of this invention, therefore, pertains to compounds or therapeutically acceptable salts, which are useful as inhibitors of anti-apoptotic Bcl-2 proteins, the compounds having Formula (I)

therapeutics, polo-like kinase (Plk) inhibitors, phosphoinositide-3 kinase (PI3K) inhibitors, proteosome inhibitors, purine analogs, pyrimidine analogs, receptor tyrosine kinase inhibitors, etinoids/deltoids plant alkaloids, small inhibitory ribonucleic acids (siRNAs), topoisomerase inhibitors, ubiquitin ligase inhibitors, and the like, and in combination with one or more of these agents.

BiTE antibodies are bi-specific antibodies that direct T-cells to attack cancer cells by simultaneously binding the two cells. The T-cell then attacks the target cancer cell. Examples of BiTE antibodies include adecatumumab (Micromet MT201), blinatumomab (Micromet MT103) and the like. Without being limited by theory, one of the mechanisms by which T-cells elicit apoptosis of the target cancer cell is by exocytosis of cytolytic granule components, which include perforin and granzyme B. In this regard, Bcl-2 has been shown to attenuate the induction of apoptosis by both perforin and granzyme B. These data suggest that inhibition of Bcl-2 could enhance the cytotoxic effects elicited by T-cells when targeted to cancer cells (V. R. Sutton, D. L. Vaux and J. A. Trapani, *J. of Immunology* 1997, 158 (12), 5783).

SiRNAs are molecules having endogenous RNA bases or chemically modified nucleotides. The modifications do not abolish cellular activity, but rather impart increased stability and/or increased cellular potency. Examples of chemical modifications include phosphorothioate groups, 2'-deoxy-nucleotide, 2'-OCH<sub>3</sub>-containing ribonucleotides, 2'-F-ribonucleotides, 2'-methoxyethyl ribonucleotides, combinations thereof and the like. The siRNA can have varying lengths (e.g., 10-200 bps) and structures (e.g., hairpins, single/double strands, bulges, nicks/gaps, mismatches) and are processed in cells to provide active gene silencing. A double-stranded siRNA (dsRNA) can have the same number of nucleotides on each strand (blunt ends) or asymmetric ends (overhangs). The overhang of 1-2 nucleotides can be present on the sense and/or the antisense strand, as well as present on the 5'- and/or the 3'-ends of a given strand. For example, siRNAs targeting Mcl-1 have been shown to enhance the activity of ABT-263, (i.e., N-(4-((4-(4-chlorophenyl)-5,5-dimethyl-1-cyclohex-1-en-1-yl)methyl)piperazin-1-yl)benzoyl)-4-(((1R)-3-(morpholin-4-yl)-1-((phenylsulfanyl)methyl)propyl)amino)-3-((trifluoromethyl)sulfonyl)benzenesulfonamide) or ABT-737 (i.e., N-(4-((4'-chloro(1,1'-biphenyl)-2-yl)methyl)piperazin-1-yl)benzoyl)-4-(((1R)-3-(dimethylamino)-1-((phenylsulfanyl)methyl)propyl)amino)-3-nitrobenzenesulfonamide) in multiple tumor cell lines (Tse et al., *Cancer Research* 2008, 68(9), 3421 and references therein).

Multivalent binding proteins are binding proteins comprising two or more antigen binding sites. Multivalent binding proteins are engineered to have the three or more antigen binding sites and are generally not naturally occurring antibodies. The term "multispecific binding protein" means a binding protein capable of binding two or more related or unrelated targets. Dual variable domain (DVD) binding proteins are tetravalent or multivalent binding proteins binding proteins comprising two or more antigen binding sites. Such DVDs may be monospecific (i.e., capable of binding one antigen) or multispecific (i.e., capable of binding two or more antigens). DVD binding proteins comprising two heavy chain DVD polypeptides and two light chain DVD polypeptides are referred to as DVD Ig's. Each half of a DVD Ig comprises a heavy chain DVD polypeptide, a light chain DVD polypeptide, and two antigen binding sites. Each binding site comprises a heavy chain variable domain and a light chain variable domain with a total of 6 CDRs involved in antigen binding per antigen binding site.

Matrix-assisted laser desorption ionization mass-spectra (MALDI-MS) were recorded on an Applied Biosystems Voyager DE-PRO MS). Electrospray mass-spectra (ESI-MS) were recorded on Finnigan SSQ7000 (Finnigan Corp., San Jose, Calif.) in both positive and negative ion mode.

**General Procedure for Solid-Phase Peptide Synthesis (SPPS)**

Peptides were synthesized with, at most, 250  $\mu$ mol pre-loaded Wang resin/vessel on an ABI 433A peptide synthesizer using 250  $\mu$ mol scale FASTMOC™ coupling cycles. Preloaded cartridges containing 1 mmol standard Fmoc-amino acids, except for the position of attachment of the fluorophore, where 1 mmol Fmoc-Lys(Mtt)-OH was placed in the cartridge, were used with conductivity feedback monitoring. N-terminal acetylation was accomplished by using 1 mmol acetic acid in a cartridge under standard coupling conditions.

**Removal of 4-Methyltrityl (Mtt) from Lysine**

The resin from the synthesizer was washed thrice with DCM and kept wet. 150 mL of 95:4:1 dichloromethane:tri-isopropylsilane:trifluoroacetic acid was flowed through the resin bed over 30 minutes. The mixture turned deep yellow then faded to pale yellow. 100 mL of DMF was flowed through the bed over 15 minutes. The resin was then washed thrice with DMF and filtered. Ninhydrin tests showed a strong signal for primary amine.

**Resin Labeling with 6-Carboxyfluorescein-NHS (6-FAM-NHS)**

The resin was treated with 2 equivalents 6-FAM-NHS in 1% DIEA/DMF and stirred or shaken at ambient temperature overnight. When complete, the resin was drained, washed thrice with DMF, thrice with (1× DCM and 1× methanol) and dried to provide an orange resin that was negative by ninhydrin test.

**General Procedure for Cleavage and Deprotection of Resin-Bound Peptide**

Peptides were cleaved from the resin by shaking for 3 hours at ambient temperature in a cleavage cocktail consisting of 80% TFA, 5% water, 5% thioanisole, 5% phenol, 2.5% TIS, and 2.5% EDT (1 mL/0.1 g resin). The resin was removed by filtration and rinsing twice with TFA. The TFA was evaporated from the filtrates, and product was precipitated with ether (10 mL/0.1 g resin), recovered by centrifugation, washed twice with ether (10 mL/0.1 g resin) and dried to give the crude peptide.

**General Procedure for Purification of Peptides**

The crude peptides were purified on a Gilson preparative HPLC system running Unipoint® analysis software (Gilson, Inc., Middleton, Wis.) on a radial compression column containing two 25×100 mm segments packed with Delta-Pak™ C18 15  $\mu$ m particles with 100 Å pore size and eluted with one of the gradient methods listed below. One to two milliliters of crude peptide solution (10 mg/mL in 90% DMSO/water) was purified per injection. The peaks containing the product(s) from each run were pooled and lyophilized. All preparative

**174**

runs were run at 20 mL/min with eluents as buffer A: 0.1% TFA-water and buffer B: acetonitrile.

**General Procedure for Analytical HPLC**

Analytical HPLC was performed on a Hewlett-Packard 1200 series system with a diode-array detector and a Hewlett-Packard 1046A fluorescence detector running HPLC 3D CHEMSTATION software version A.03.04 (Hewlett-Packard, Palo Alto, Calif.) on a 4.6×250 mm YMC column packed with ODS-AQ 5  $\mu$ m particles with a 120 Å pore size and eluted with one of the gradient methods listed below after preequilibrating at the starting conditions for 7 minutes. Eluents were buffer A: 0.1% TFA-water and buffer B: acetonitrile. The flow rate for all gradients was 1 mL/min.

F-Bak: Peptide Probe Acetyl-GQVGRQLATIGDK  
(6-FAM) INR-NH<sub>2</sub>

Fmoc-Rink amide MBHA resin was extended using the general peptide synthesis procedure to provide the protected resin-bound peptide (1.020 g). The Mtt group was removed, labeled with 6-FAM-NHS and cleaved and deprotected as described hereinabove to provide the crude product as an orange solid (0.37 g). This product was purified by RP-HPLC. Fractions across the main peak were tested by analytical RP-HPLC, and the pure fractions were isolated and lyophilized, with the major peak providing the title compound (0.0802 g) as a yellow solid; MALDI-MS m/z=2137.1 [(M+H)<sup>+</sup>].

(SEQ ID NO: 1)  
Alternative Synthesis of Peptide Probe F-Bak:  
Acetyl-GQVGRQLATIGDK(6-FAM) INR-NH<sub>2</sub>

The protected peptide was assembled on 0.25 mmol Fmoc-Rink amide MBHA resin (Novabiochem) on an Applied Bio-systems 433A automated peptide synthesizer running FASTMOC™ coupling cycles using pre-loaded 1 mmol amino acid cartridges, except for the fluorescein(6-FAM)-labeled lysine, where 1 mmol Fmoc-Lys(4-methyltrityl) was weighed into the cartridge. The N-terminal acetyl group was incorporated by putting 1 mmol acetic acid in a cartridge and coupling as described hereinabove. Selective removal of the 4-methyltrityl group was accomplished with a solution of 95:4:1 DCM:TIS:TFA (v/v/v) flowed through the resin over 15 minutes, followed by quenching with a flow of dimethylformamide. Single-isomer 6 carboxyfluorescein-NHS was reacted with the lysine side-chain in 1% DIEA in DMF and confirmed complete by ninhydrin testing. The peptide was cleaved from the resin and side-chains deprotected by treating with 80:5:5:5:2.5:2.5 TFA/water/phenol/thioanisole/triisopropylsilane:3,6-dioxa-1,8-octanedithiol (v/v/v/v/v), and the crude peptide was recovered by precipitation with diethyl ether. The crude peptide was purified by reverse-phase high-performance liquid chromatography, and its purity and identity were confirmed by analytical reverse-phase high-performance liquid chromatography and matrix-assisted laser-desorption mass-spectrometry (m/z=2137.1 ((M+H)<sup>+</sup>)).

**Time Resolved-Fluorescence Resonance Energy Transfer (TR-FRET) Assay**

Representative compounds were serially diluted in dimethyl sulfoxide (DMSO) starting at 50  $\mu$ M (2 $\times$  starting concentration; 10% DMSO) and 10  $\mu$ L were transferred into a

384-well plate. Then 10  $\mu$ L of a protein/probe/antibody mix was added to each well at final concentrations listed in TABLE 1. The samples are then mixed on a shaker for 1 minute and incubated for an additional 3 hours at room temperature. For each assay, the probe/antibody and protein/probe/antibody were included on each assay plate as negative and positive controls, respectively. Fluorescence was measured on the ENVISION plate reader (Perkin Elmer) using a 340/35 nm excitation filter and 520/525 (F-Bak peptide) and 495/510 nm (Tb-labeled anti-Histidine antibody) emission filters. Dissociation constants ( $K_i$ ) are shown in TABLE 2 below and were determined using Wang's equation (Wang Z.-X. An Exact Mathematical Expression For Describing Competitive Binding Of Two Different Ligands To A Protein Molecule. *FEBS Lett.* 1995, 360:111-4).

The samples were then mixed on a shaker for 1 minute and incubated for an additional 3 hours at room temperature. For each assay, the probe/antibody and protein/probe/antibody were included on each assay plate as negative and positive controls, respectively. Inhibition constants ( $K_i$ ) for compounds according to the invention are shown in TABLE 2 below. Where the  $K_i$  for a compound is represented as " $<$ " (less than) a certain numerical value, it is intended to mean that the binding affinity value (e.g., for Bcl-2) is lower than the limit of detection of the assay used. Inhibition constants were determined using Wang's equation (Wang Zx, An Exact Mathematical Expression For Describing Competitive Binding Of Two Different Ligands To A Protein Molecule. *FEBS Lett.* 1995, 360:111-4).

The inhibition constant (K<sub>i</sub>) is the dissociation constant of an enzyme-inhibitor complex or a protein/small molecule complex, wherein the small molecule is inhibiting binding of one protein to another protein or peptide. So a large K<sub>i</sub> value indicates a low binding affinity and a small K<sub>i</sub> value indicates a high binding affinity.

TABLE 2 shows inhibition constants for the inhibition of a Bak BH3 peptide probe to Bcl-2 protein and indicate that compounds according to the invention have high binding affinities for anti-apoptotic Bcl-2 protein. The compounds are therefore expected to have utility in treatment of diseases during which anti-apoptotic Bcl-2 protein is expressed.

## RS4;11 Cell Viability Assay

The acute lymphoblastic leukemia (ALL) cell line RS4;11 was used as the primary human cell line to assess the cellular activity of Bcl-2 selective agents in vitro and their efficacy in vivo. Previous studies have shown by BH3 profiling, a mitochondrial assay that classifies blocks in the intrinsic apoptotic pathway, that RS4;11 cells were highly dependant on BCL-2 for survival and sensitive to the Bcl-2 family member inhibitor ABT-737 (Blood, 2008, Vol. 111, 2300-2309). The prevalence of Bcl-2 complexed to the proapoptotic BH3 protein Bim in RS4;11 suggests that these cells are “primed” or more susceptible to cell death by antagonism of the antiapoptotic protein Bcl-2 for which they depend on for survival.

RS4;11 cells were cultured in RPMI-1640 supplemented with 2 mM L-glutamine, 10% FBS, 1 mM sodium pyruvate, 2 mM HEPES, 1% penicillin/streptomycin (Invitrogen), 4.5 g/L glucose and maintained at 37 C containing 5% CO<sub>2</sub>. To test for the cellular activity of compounds in vitro, cells were treated at 50,000 cells per well in 96-well microtiter plates in the presence of 10% human serum for 48 hours in a humidified chamber with 5% CO<sub>2</sub>. Cell cytotoxicity EC<sub>50</sub> values were assessed using CellTiter Glo (Promega) according to the manufacturer's recommendations. The EC<sub>50</sub> values were determined as a percentage of viable cells following treatment compared to the untreated control cells.

TABLE 3 shows the utility of compounds having Formula I to functionally inhibit anti-apoptotic Bcl-2 protein in a cellular context. The acute lymphoblastic leukemia (ALL) cell line RS4;11 has been shown by BH3 profiling, a mitochondrial assay that classifies blocks in the intrinsic apoptotic pathway, to be highly dependant on Bcl-2 for survival and is sensitive to the Bcl-2 family member inhibitor ABT-737 (*Blood*, 2008, Vol. 111, 2300-2309). The ability of compounds to kill RS4;11 cells is a direct measure of the compounds ability to inhibit anti-apoptotic Bcl-2 protein function. Compounds of Formula I are very effective in killing RS4;11 cells as demonstrated by low EC<sub>50</sub> values.

**187**

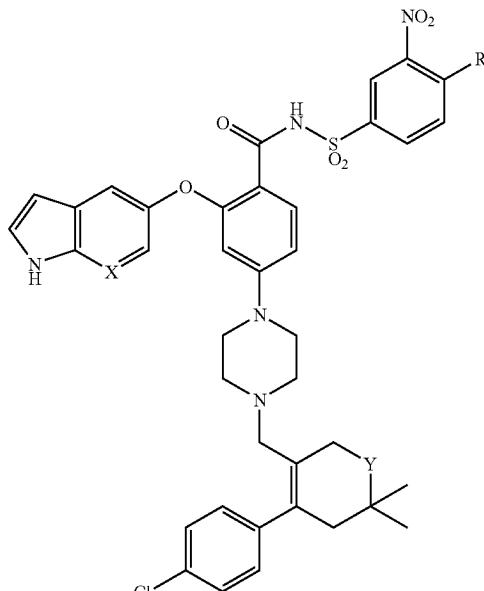

Compounds taught in U.S. patent application Ser. No. 12/631,404, entitled "BCL-2-SELECTIVE APOPTOSIS-INDUCING AGENTS FOR THE TREATMENT OF CANCER AND IMMUNE DISEASES," filed on Dec. 4, 2009, have utility for the treatment of various cancers and autoimmune diseases due to their activity against Bcl-2 family proteins, and more specifically Bcl-2. These compounds bind to Bcl-2 with high affinity in a FRET based assay described in Ser. No. 12/631,404. The administration of a one or more of these compounds to cells that are dependant on Bcl-2 or Bcl-2 family proteins for survival, such as the RS4;11 B-cell leukemia human tumor cell line, results in apoptosis, also known as programmed cell death. The amount of apoptosis caused by administration of the compound is represented by the EC<sub>50</sub> in the cell viability assay, which is a measure of the number of living cells after administration of compound.

TABLE 4 identifies certain compounds (described below in Examples in 19, 20, 23 and 92 and described more fully in Ser. No. 12/631,404, the disclosure of which is incorporated herein by reference) with the various substituents being defined by R, X and Y as set forth. As can be seen from TABLE 4, these compounds exhibit a trend of increasing binding affinity ( $K_i$ ) for Bcl-2 with increasing levels of apoptosis, or cell death, in the Bcl-2 dependant tumor cell line RS4;11. On this basis, the inventors expect that compounds with even greater affinity towards Bcl-2 than those compounds shown in Table 4 will exhibit a similar trend, potentially eliciting even greater levels of apoptosis, when administered to cells dependent on Bcl-2 for survival.

To this end, binding affinity and cellular activity for compounds according to the present invention were compared with structurally similar indole compounds. In particular, the compounds of the present invention, in which a nitrogen is contained at a specific position within the heteroarene fused to the heteroaryl ring were compared with the corresponding indole compounds, which latter compounds lack only the specific nitrogen substitution included in the compounds of the present invention.

As can be seen in TABLE 5, compounds of the present invention having the specific nitrogen substitutions shown (i.e., compounds of Examples 1, 2, 3, 4, 5, 6, 9, 10, 11, 12, 13, 15, 16, and 17, where Z=N) in fact achieve relatively greater levels of apoptosis when administered to cells that depend on Bcl-2 for survival and have increased affinity towards Bcl-2 relative to the corresponding structural analogs lacking the specific nitrogen substitution (i.e., compounds of Examples 87, 88, 89, 90, 91, 19, 20, 21, 92, 22, 23, 93, and 94, respectively, where Z=C, taught in 9696USL2, the disclosure of which is incorporated herein by reference).

Specifically, the seventh column of TABLE 5 compares binding affinity of compounds of the present invention (the compound identified by the designated substituents in the uppermost row in each pair of rows set apart by blank rows) to corresponding compounds lacking the described nitrogen substitution. In each comparison, compounds of the present application (upper row of each pair of rows separated by a blank row) bind Bcl-2 with greater affinity to Bcl-2 than the corresponding analogs (lower row of each pair of rows separated by a blank row).

Further, column 8 of TABLE 5 compares the amount of apoptosis in the Bcl-2 dependant RS4;11 cell line achieved using compounds of the present invention (again the compound identified by the designated substituents in the uppermost row in each pair of rows set apart by blank rows) to that achieved using compounds of Examples 87, 88, 89, 90, 91, 19, 20, 21, 92, 22, 23, 93, and 94, where Z=C. In each comparison, compounds of the present invention (upper row of each pair of rows separated by a blank row) achieve greater extent of apoptosis in Bcl-2 dependent RS4;11 cells than the corresponding analogs (lower row of each pair of rows separated by a blank row).

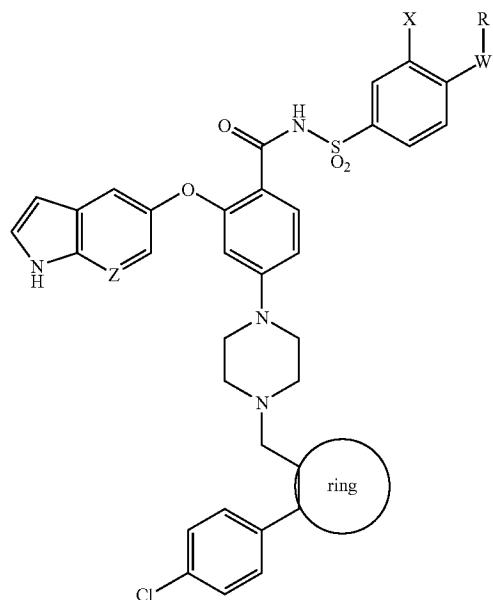

The increase in binding affinity between the compounds of the present invention and corresponding analogs ranges from 2.7 $\times$  to greater than 100 $\times$ , and the increased potency in RS4;11 cells ranges from a 1.65 $\times$  increase to greater than 10 $\times$  increase.

As detailed below, a specific substitution of a nitrogen atom for a carbon atom leads to unexpected increase in binding affinity to antiapoptotic Bcl-2 and increase in potency in cell viability assays assessing apoptosis in Bcl-2 dependent cell lines.

This invention therefore comprises a series of compounds that demonstrate unexpected properties with respect to their binding to and inhibiting the activity of anti-apoptotic Bcl-2 protein to a significantly greater extent than corresponding analog compounds.

More specifically, compounds of the present invention contain a substitution pattern shown in the diagram below.

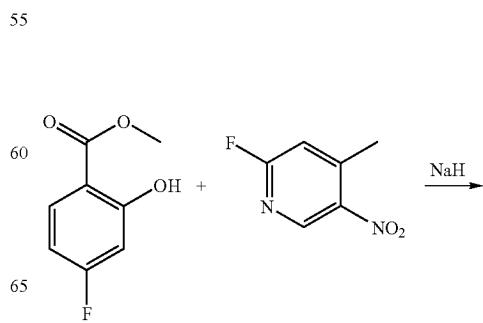

25 -continued

Other compounds that contain isomeric ring systems to that shown above, such as those rings systems containing a nitrogen adjacent to the oxygenated carbon within the ring, as shown below, are compromised by instability.

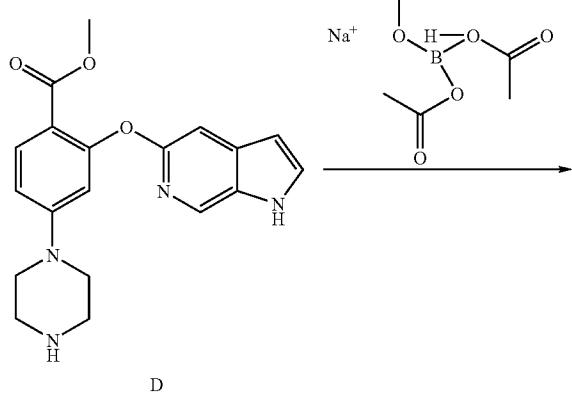

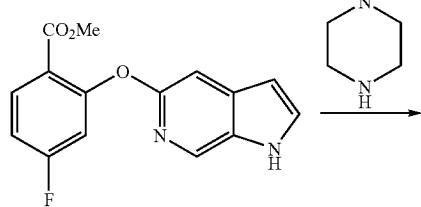

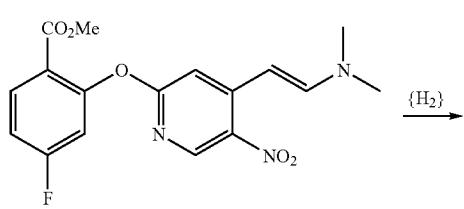

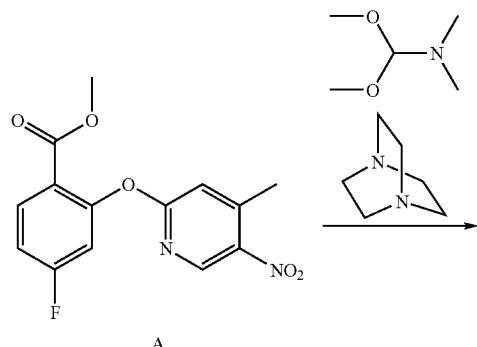

Specifically, this was discovered by the inventors in the following compound preparation. The intermediate structure 50 F, that directly precedes the final product of the unstable compound, was prepared according to the route below. All intermediates A-F were stable and isolable using techniques known to those skilled in the art.

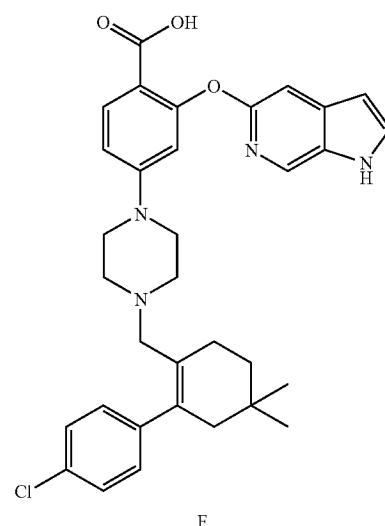

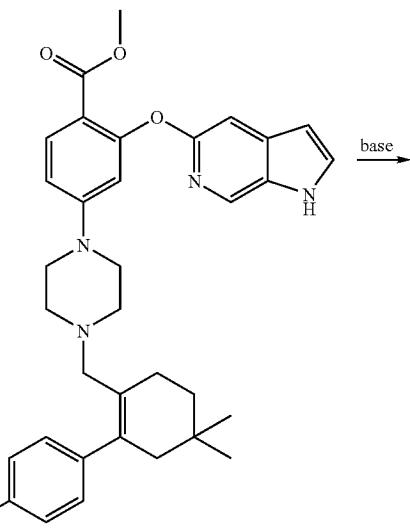

US 8,546,399 B2

199

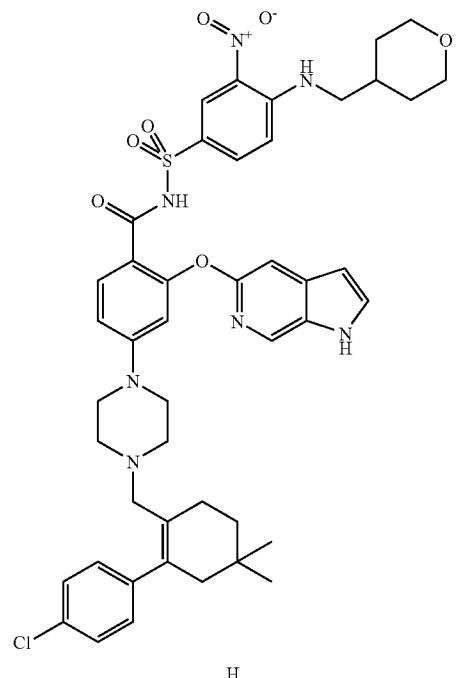

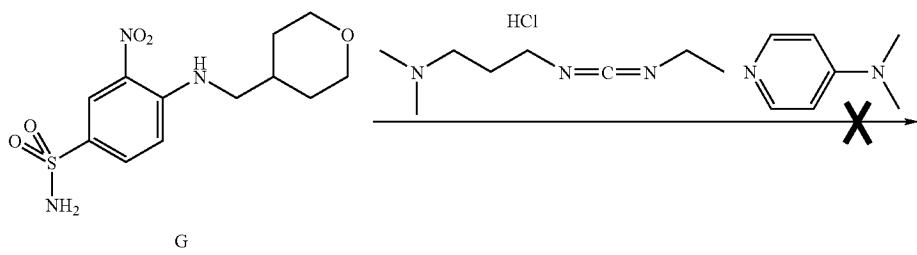

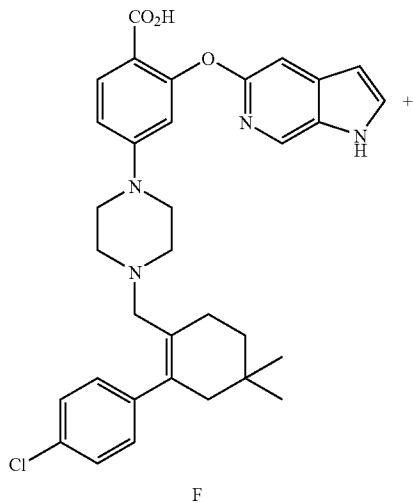

200

Intermediate F, shown in the scheme above, was reacted with intermediate G using standard coupling conditions that are known to those skilled in the art. The reaction mixture was analyzed via HPLC/MS to monitor the formation of a peak corresponding to the compound H. While this peak formed within hours of initiating the reaction below, the peak progressively disappeared during workup and chromatography, until it no longer was present. The lack of stability of the putative compound originates from the position of the nitrogen within the fused ring-system described above. This position, which is adjacent to the oxygen-bearing carbon in the 5-substituted-1H-pyrrolo[2,3-c]pyridine ring system shown below and described above, makes the compound H unstable.

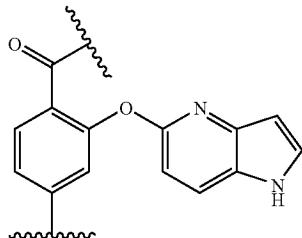

US 8,546,399 B2

**201****202**

US 8,546,399 B2

203

It is expected that a compound containing the fused 5-substituted-1H-pyrrolo[3,2-b]pyridine ring system below would be similarly unstable, since the position of the nitrogen is adjacent to the oxygen-bearing carbon within the ring.

Therefore, compounds with the 5-substituted-1H-pyrrolo[3,2-b]pyridines are preferred over the isomeric compounds.

It is expected that, because compounds having Formula (I) bind to Bcl-2, they would also have utility as binders to anti-apoptotic proteins having close structural homology to Bcl-2, such as, for example, anti-apoptotic Bcl-X<sub>L</sub>, Bcl-w, Mcl-1 and Bfl-1/A1 proteins.

## Example 15A

methyl 6,6-dimethyl-4-oxotetrahydro-2H-pyran-3-carboxylate

To a suspension of hexane-washed NaH (0.72 g, 60% in mineral oil) in tetrahydrofuran (30 mL) was added a solution of 2,2-dimethyldihydro-2H-pyran-4(3H)-one (2.0 g) in tetrahydrofuran (20 mL). The suspension was stirred at room temperature for 30 minutes. The dimethylcarbonate (6.31 mL) was added dropwise by syringe. The mixture was heated to reflux for 4 h. LC/MS showed the expected product as the major product. The mixture was acidified with 5% HCl and extracted with dichloromethane (100 mL×3) and washed with water, brine and dried over Na<sub>2</sub>SO<sub>4</sub>. After evaporation, the crude product was loaded on a column and eluted with 10% ethyl acetate in hexane to give the product.

## Example 15B

Separately, EXAMPLE 288C (1.14 g) in dioxane (5 mL) was added to concentrated HCl (20 mL) at 0° C. The solution was stirred for 5 minutes. To this suspension/solution was added sodium nitrite (0.44 g) in water (6 mL) dropwise at 0° C. The solution was stirred at 0° C. for 3 hours. During this time, any solid formed was crushed with a glass rod to make sure that EXAMPLE 288C was completely reacted. To the SO<sub>2</sub> containing solution was added copper(I) chloride (0.115 g). Then, to this solution was added the diazotized EXAMPLE 288C at 0° C. The solution was stirred for 30 minutes. The reaction mixture was extracted with ethyl acetate. The combined organic layers were washed with brine, dried over MgSO<sub>4</sub>, filtered, and concentrated under reduced pressure. The residue was purified by flash column chromatography on silica gel eluting with 5% ethyl acetate in hexanes to provide the title compound.

The organic phase was washed with brine, dried over MgSO<sub>4</sub>, filtered, and concentrated under reduced pressure. The residue was purified by flash column chromatography on silica gel eluting with 0-3% methanol in dichloromethane to afford the title compound.

**APOPTOSIS-INDUCING AGENTS FOR THE TREATMENT OF CANCER AND IMMUNE AND AUTOIMMUNE DISEASES**

This application is a divisional of U.S. patent application Ser. No. 12/787,682 filed May 26, 2010, which claims benefit of U.S. Provisional Application No. 61/181,203 filed May 26, 2009, each of which is incorporated herein by reference in its entirety.

**FIELD OF THE INVENTION**

This invention pertains to compounds which inhibit the activity of Bcl-2 anti-apoptotic proteins, compositions containing the compounds, and methods of treating diseases during which anti-apoptotic Bcl-2 proteins are expressed.

**BACKGROUND OF THE INVENTION**

Anti-apoptotic Bcl-2 proteins are associated with a number of diseases. There is therefore an existing need in the therapeutic arts for compounds which inhibit the activity of anti-apoptotic Bcl-2 proteins.

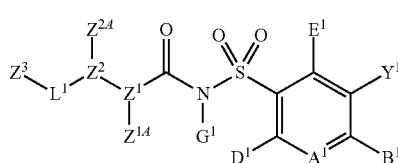

Overexpression of Bcl-2 proteins correlates with resistance to chemotherapy, clinical outcome, disease progression, overall prognosis or a combination thereof in various cancers and disorders of the immune system.

Involvement of Bcl-2 proteins in bladder cancer, brain cancer, breast cancer, bone marrow cancer, cervical cancer, chronic lymphocytic leukemia, colorectal cancer, esophageal cancer, hepatocellular cancer, lymphoblastic leukemia, follicular lymphoma, lymphoid malignancies of T-cell or B-cell origin, melanoma, myelogenous leukemia, myeloma, oral cancer, ovarian cancer, non-small cell lung cancer, prostate cancer, small cell lung cancer, spleen cancer, and the like is described in commonly-owned PCT US 2004/36770, published as WO 2005/049593, and PCT US 2004/37911, published as WO 2005/024636.

Involvement of Bcl-2 proteins in immune and autoimmune diseases is described in *Current Allergy and Asthma Reports* 2003, 3, 378-384; *British Journal of Haematology* 2000, 110(3), 584-90; *Blood* 2000, 95(4), 1283-92; and *New England Journal of Medicine* 2004, 351(14), 1409-1418. Involvement of Bcl-2 proteins in arthritis is disclosed in commonly-owned U.S. Provisional Patent Application Ser. No. 60/988,479. Involvement of Bcl-2 proteins in bone marrow transplant rejection is disclosed in commonly-owned U.S. patent application Ser. No. 11/941,196.

**SUMMARY OF THE INVENTION**

One embodiment of this invention, therefore, pertains to compounds or therapeutically acceptable salts, which are useful as inhibitors of anti-apoptotic Bcl-2 proteins, the compounds having Formula (I)

wherein

Compounds

Geometric isomers may exist in the present compounds. Compounds of this invention may contain carbon-carbon double bonds or carbon-nitrogen double bonds in the E or Z configuration, wherein the term “E” represents higher order substituents on opposite sides of the carbon-carbon or carbon-nitrogen double bond and the term “Z” represents higher order substituents on the same side of the carbon-carbon or carbon-nitrogen double bond as determined by the Cahn-Ingold-Prelog Priority Rules. The compounds of this invention may also exist as a mixture of “E” and “Z” isomers. Substituents around a cycloalkyl or heterocycloalkyl are designated as being of cis or trans configuration. Furthermore,

the invention contemplates the various isomers and mixtures thereof resulting from the disposal of substituents around an adamantanane ring system. Two substituents around a single ring within an adamantanane ring system are designated as being of Z or E relative configuration. For examples, see C. D. Jones, M. Kaselj, R. N. Salvatore, W. J. le Noble *J. Org. Chem.* 1998, 63, 2758-2760.

Compounds of this invention may contain asymmetrically substituted carbon atoms in the R or S configuration, in which the terms "R" and "S" are as defined by the IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem. (1976) 45, 13-10. Compounds having asymmetrically substituted carbon atoms with equal amounts of R and S configurations are racemic at those carbon atoms. Atoms with an excess of one configuration over the other are assigned the configuration present in the higher amount, preferably an excess of about 85%-90%, more preferably an excess of about 95%-99%, and still more preferably an excess greater than about 99%. Accordingly, this invention includes racemic mixtures, relative and absolute stereoisomers, and mixtures of relative and absolute stereoisomers.

#### Isotope Enriched or Labeled Compounds

Compounds of the invention can exist in isotope-labeled or -enriched form containing one or more atoms having an atomic mass or mass number different from the atomic mass or mass number most abundantly found in nature. Isotopes can be radioactive or non-radioactive isotopes. Isotopes of atoms such as hydrogen, carbon, phosphorous, sulfur, fluorine, chlorine, and iodine include, but are not limited to, <sup>2</sup>H, <sup>3</sup>H, <sup>13</sup>C, <sup>14</sup>C, <sup>15</sup>N, <sup>18</sup>O, <sup>32</sup>P, <sup>35</sup>S, <sup>18</sup>F, <sup>36</sup>Cl, and <sup>125</sup>I. Compounds that contain other isotopes of these and/or other atoms are within the scope of this invention.

In another embodiment, the isotope-labeled compounds contain deuterium (<sup>2</sup>H), tritium (<sup>3</sup>H) or <sup>14</sup>C isotopes. Isotope-labeled compounds of this invention can be prepared by the general methods well known to persons having ordinary skill in the art. Such isotope-labeled compounds can be conveniently prepared by carrying out the procedures disclosed in the Examples disclosed herein and Schemes by substituting a readily available isotope-labeled reagent for a non-labeled reagent. In some instances, compounds may be treated with isotope-labeled reagents to exchange a normal atom with its isotope, for example, hydrogen for deuterium can be exchanged by the action of a deuteric acid such as D<sub>2</sub>SO<sub>4</sub>/D<sub>2</sub>O. In addition to the above, relevant procedures and intermediates are disclosed, for instance, in Lizondo, J et al., *Drugs Fut.* 21(11), 1116 (1996); Brickner, S J et al., *J Med Chem.* 39(3), 673 (1996); Mallesham, B et al., *Org Lett.* 5(7), 963 (2003); PCT publications WO1997010223, WO2005099353, WO1995007271, WO2006008754; U.S. Pat. The isotope-labeled compounds of the invention may be used as standards to determine the effectiveness of Bcl-2 inhibitors in binding assays. Isotope containing compounds have been used in pharmaceutical research to investigate the in vivo metabolic fate of the compounds by evaluation of the mechanism of action and metabolic pathway of the nonisotope-labeled parent compound (Blake et al. *J. Pharm. Sci.* 64, 3, 367-391 (1975)). Such metabolic studies are important in the design of safe, effective therapeutic drugs, either because the in vivo active compound administered to the patient or because the metabolites produced from the parent compound prove to be toxic or carcinogenic (Foster et al., Advances in Drug Research Vol. 14, pp. 2-36, Academic press, London,

1985; Kato et al., *J. Labelled Comp. Radiopharmaceut.*, 36(10):927-932 (1995); Kushner et al., *Can. J. Physiol. Pharmacol.*, 77, 79-88 (1999).

In addition, non-radio active isotope containing drugs, such as deuterated drugs called "heavy drugs," can be used for the treatment of diseases and conditions related to Bcl-2 activity. Increasing the amount of an isotope present in a compound above its natural abundance is called enrichment. Examples of the amount of enrichment include from about 0.5, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 16, 21, 25, 29, 33, 37, 42, 46, 50, 54, 58, 63, 67, 71, 75, 79, 84, 88, 92, 96, to about 100 mol %. Replacement of up to about 15% of normal atom with a heavy isotope has been effected and maintained for a period of days to weeks in mammals, including rodents and dogs, with minimal observed adverse effects (Czajka D M and Finkel A J, *Ann. N.Y. Acad. Sci.* 1960 84: 770; Thomson J F, *Ann. New York Acad. Sci.* 1960 84: 736; Czakja D M et al., *Am. J. Physiol.* 1961 201: 357). Acute replacement of as high as 15%-23% in human fluids with deuterium was found not to cause toxicity (Blagojevic N et al. in "Dosimetry & Treatment Planning for Neutron Capture Therapy", Zamenhof R, Solares G and Harling O Eds. 1994. Advanced Medical Publishing, Madison Wis. pp. 125-134; *Diabetes Metab.* 23: 251 (1997)).

Stable isotope labeling of a drug can alter its physicochemical properties such as pKa and lipid solubility. These effects and alterations can affect the pharmacodynamic response of the drug molecule if the isotopic substitution affects a region involved in a ligand-receptor interaction. While some of the physical properties of a stable isotope-labeled molecule are different from those of the unlabeled one, the chemical and biological properties are the same, with one important exception: because of the increased mass of the heavy isotope, any bond involving the heavy isotope and another atom will be stronger than the same bond between the light isotope and that atom. Accordingly, the incorporation of an isotope at a site of metabolism or enzymatic transformation will slow said reactions potentially altering the pharmacokinetic profile or efficacy relative to the non-isotopic compound.

small inhibitory ribonucleic acids (siRNAs), topoisomerase inhibitors, ubiquitin ligase inhibitors, and the like, and in combination with one or more of these agents.

BiTE antibodies are bi-specific antibodies that direct T-cells to attack cancer cells by simultaneously binding the two cells. The T-cell then attacks the target cancer cell. Examples of BiTE antibodies include adecatumumab (Micromet MT201), blinatumomab (Micromet MT103) and the like. Without being limited by theory, one of the mechanisms by which T-cells elicit apoptosis of the target cancer cell is by exocytosis of cytolytic granule components, which include perforin and granzyme B. In this regard, Bcl-2 has been shown to attenuate the induction of apoptosis by both perforin and granzyme B. These data suggest that inhibition of Bcl-2 could enhance the cytotoxic effects elicited by T-cells when targeted to cancer cells (V. R. Sutton, D. L. Vaux and J. A. Trapani, *J. of Immunology* 1997, 158 (12), 5783).

SiRNAs are molecules having endogenous RNA bases or chemically modified nucleotides. The modifications do not abolish cellular activity, but rather impart increased stability and/or increased cellular potency. Examples of chemical modifications include phosphorothioate groups, 2'-deoxy-nucleotide, 2'-OCH<sub>3</sub>-containing ribonucleotides, 2'-F-ribonucleotides, 2'-methoxyethyl ribonucleotides, combinations thereof and the like. The siRNA can have varying lengths (e.g., 10-200 bps) and structures (e.g., hairpins, single/double strands, bulges, nicks/gaps, mismatches) and are processed in cells to provide active gene silencing. A double-stranded siRNA (dsRNA) can have the same number of nucleotides on each strand (blunt ends) or asymmetric ends (overhangs). The overhang of 1-2 nucleotides can be present on the sense and/or the antisense strand, as well as present on the 5'- and/or the 3'-ends of a given strand. For example, siRNAs targeting Mcl-1 have been shown to enhance the activity of ABT-263, (i.e., N-(4-(4-((2-(4-chlorophenyl)-5,5-dimethyl-1-cyclohex-1-en-1-yl)methyl)piperazin-1-yl)benzoyl)-4-(((1R)-3-(morpholin-4-yl)-1-((phenylsulfanyl)methyl)propyl)amino)-3-((trifluoromethyl)sulfonyl)benzenesulfonamide) or ABT-737 (i.e., N-(4-(4-((4'-chlorophenyl)-2-yl)methyl)piperazin-1-yl)benzoyl)-4-(((1R)-3-(dimethylamino)-1-((phenylsulfanyl)methyl)propyl)amino)-3-nitrobenzenesulfonamide) in multiple tumor cell lines (Tse et al., *Cancer Research* 2008, 68(9), 3421 and references therein).

Multivalent binding proteins are binding proteins comprising two or more antigen binding sites. Multivalent binding proteins are engineered to have the three or more antigen binding sites and are generally not naturally occurring antibodies. The term "multispecific binding protein" means a binding protein capable of binding two or more related or unrelated targets. Dual variable domain (DVD) binding proteins are tetravalent or multivalent binding proteins binding proteins comprising two or more antigen binding sites. Such DVDs may be monospecific (i.e., capable of binding one antigen) or multispecific (i.e., capable of binding two or more antigens). DVD binding proteins comprising two heavy chain DVD polypeptides and two light chain DVD polypeptides are referred to as DVD Ig's. Each half of a DVD Ig comprises a heavy chain DVD polypeptide, a light chain DVD polypeptide, and two antigen binding sites. Each binding site comprises a heavy chain variable domain and a light chain variable domain with a total of 6 CDRs involved in antigen binding per antigen binding site.

Electrospray mass-spectra (ESI-MS) were recorded on Finnigan SSQ7000 (Finnigan Corp., San Jose, Calif.) in both positive and negative ion mode.

#### General Procedure for Solid-Phase Peptide Synthesis (SPPS)

Peptides were synthesized with, at most, 250  $\mu$ mol pre-loaded Wang resin/vessel on an ABI 433A peptide synthesizer using 250  $\mu$ mol scale FASTMOCTM coupling cycles. Preloaded cartridges containing 1 mmol standard Fmoc-amino acids, except for the position of attachment of the fluorophore, where 1 mmol Fmoc-Lys(Mtt)-OH was placed in the cartridge, were used with conductivity feedback monitoring. N-terminal acetylation was accomplished by using 1 mmol acetic acid in a cartridge under standard coupling conditions.

#### Removal of 4-Methyltrityl (Mtt) from Lysine

The resin from the synthesizer was washed thrice with 30 DCM and kept wet. 150 mL of 95:4:1 dichloromethane:tri-isopropylsilane:trifluoroacetic acid was flowed through the resin bed over 30 minutes. The mixture turned deep yellow then faded to pale yellow. 100 mL of DMF was flowed through the bed over 15 minutes. The resin was then washed thrice with DMF and filtered. Ninhydrin tests showed a strong signal for primary amine.

#### Resin Labeling with 6-Carboxyfluorescein-NHS (6-FAM-NHS)

The resin was treated with 2 equivalents 6-FAM-NHS in 1% DIEA/DMF and stirred or shaken at ambient temperature overnight. When complete, the resin was drained, washed thrice with DMF, thrice with (1 $\times$ DCM and 1 $\times$ methanol) and dried to provide an orange resin that was negative by ninhydrin test.

#### General Procedure for Cleavage and Deprotection of Resin-Bound Peptide

Peptides were cleaved from the resin by shaking for 3 hours at ambient temperature in a cleavage cocktail consisting of 80% TFA, 5% water, 5% thioanisole, 5% phenol, 2.5% TIS, and 2.5% EDT (1 mL/0.1 g resin). The resin was removed by filtration and rinsing twice with TFA. The TFA was evaporated from the filtrates, and product was precipitated with ether (10 mL/0.1 g resin), recovered by centrifugation, washed twice with ether (10 mL/0.1 g resin) and dried to give the crude peptide.

#### General Procedure for Purification of Peptides

The crude peptides were purified on a Gilson preparative HPLC system running Unipoint® analysis software (Gilson,

US 9,174,982 B2

Inc., Middleton, Wis.) on a radial compression column containing two 25×100 mm segments packed with Delta-Pak™ C18 15 µm particles with 100 Å pore size and eluted with one of the gradient methods listed below. One to two milliliters of crude peptide solution (10 mg/mL in 90% DMSO/water) was purified per injection. The peaks containing the product(s) from each run were pooled and lyophilized. All preparative runs were run at 20 mL/min with eluents as buffer A: 0.1% TFA-water and buffer B: acetonitrile.

#### General Procedure for Analytical HPLC

Analytical HPLC was performed on a Hewlett-Packard 1200 series system with a diode-array detector and a Hewlett-Packard 1046A fluorescence detector running HPLC 3D CHEMSTATION software version A.03.04 (Hewlett-Packard, Palo Alto, Calif.) on a 4.6×250 mm YMC column packed with ODS-AQ 5 µm particles with a 120 Å pore size and eluted with one of the gradient methods listed below after preequilibrating at the starting conditions for 7 minutes. Eluents were buffer A: 0.1% TFA-water and buffer B: acetonitrile. The flow rate for all gradients was 1 mL/min.

MOC™ coupling cycles using pre-loaded 1 mmol amino acid cartridges, except for the fluorescein(6-FAM)-labeled lysine, where 1 mmol Fmoc-Lys(4-methyltrityl) was weighed into the cartridge. The N-terminal acetyl group was incorporated by putting 1 mmol acetic acid in a cartridge and coupling as described hereinabove. Selective removal of the 4-methyltrityl group was accomplished with a solution of 95:4:1 DCM:TIS:TFA (v/v/v) flowed through the resin over 15 minutes, followed by quenching with a flow of dimethylformamide. Single-isomer 6 carboxyfluorescein-NHS was reacted with the lysine side-chain in 1% DIEA in DMF and confirmed complete by ninhydrin testing. The peptide was cleaved from the resin and side-chains deprotected by treating with 80:5:5:5:2.5:2.5 TFA/water/phenol/thioanisole/triisopropylsilane:3,6-dioxa-1,8-octanedithiol (v/v/v/v/v), and the crude peptide was recovered by precipitation with diethyl ether. The crude peptide was purified by reverse-phase high-performance liquid chromatography, and its purity and identity were confirmed by analytical reverse-phase high-performance liquid chromatography and matrix-assisted laser-desorption mass-spectrometry (m/z=2137.1 ((M+H)<sup>+</sup>)).

Representative compounds were serially diluted in dimethyl sulfoxide (DMSO) starting at 50 µM (2x starting concentration; 10% DMSO) and 10 µL were transferred into a 384-well plate. Then 10 µL of a protein/probe/antibody mix was added to each well at final concentrations listed in TABLE 1. The samples are then mixed on a shaker for 1 minute and incubated for an additional 3 hours at room temperature. For each assay, the probe/antibody and protein/probe/antibody were included on each assay plate as negative and positive controls, respectively. Where the  $K_i$  for a compound is represented as “<” (less than) a certain numerical value, it is intended to mean that the binding affinity value (e.g., for Bcl-2) is lower than the limit of detection of the assay used. Inhibition constants were determined using Wang’s equation (Wang Zx. The inhibition constant ( $K_i$ ) is the dissociation constant of an enzyme-inhibitor complex or a protein/small molecule complex, wherein the small molecule is inhibiting binding of one protein to another protein or peptide. So a large  $K_i$  value indicates a low binding affinity and a small  $K_i$  value indicates a high binding affinity.

TABLE 2 shows inhibition constants for the inhibition of a Bak BH3 peptide probe to Bcl-2 protein and indicate that compounds according to the invention have high binding affinities for anti-apoptotic Bcl-2 protein. The compounds are therefore expected to have utility in treatment of diseases during which anti-apoptotic Bcl-2 protein is expressed.

RS4; 11 Cell Viability Assay

50

The acute lymphoblastic leukemia (ALL) cell line RS4; 11 was used as the primary human cell line to assess the cellular activity of Bcl-2 selective agents in vitro and their efficacy in vivo. Previous studies have shown by BH3 profiling, a mitochondrial assay that classifies blocks in the intrinsic apoptotic pathway, that RS4; 11 cells were highly dependant on BCL-2 for survival and sensitive to the Bcl-2 family member inhibitor ABT-737 (Blood, 2008, Vol. 111, 2300-2309). The prevalence of Bcl-2 complexed to the proapoptotic BH3 protein Bim in RS4; 11 suggests that these cells are “primed” or more susceptible to cell death by antagonism of the antiapoptotic protein Bcl-2 for which they depend on for survival.

**181**

RS4; 11 cells were cultured in RPMI-1640 supplemented with 2 mM L-glutamine, 10% FBS, 1 mM sodium pyruvate, 2 mM HEPES, 1% penicillin/streptomycin (Invitrogen), 4.5 g/L glucose and maintained at 37 C containing 5% CO<sub>2</sub>. To test for the cellular activity of compounds in vitro, cells were treated at 50,000 cells per well in 96-well microtiter plates in the presence of 10% human serum for 48 hours in a humidified chamber with 5% CO<sub>2</sub>. Cell cytotoxicity EC<sub>50</sub> values were assessed using CellTiter Glo (Promega) according to the manufacturer's recommendations. The EC<sub>50</sub> values were determined as a percentage of viable cells following treatment compared to the untreated control cells.

25 TABLE 3 shows the utility of compounds having Formula I to functionally inhibit anti-apoptotic Bcl-2 protein in a cellular context. The acute lymphoblastic leukemia (ALL) cell line RS4; 11 has been shown by BH3 profiling, a mitochondrial assay that classifies blocks in the intrinsic apoptotic pathway, to be highly dependant on Bcl-2 for survival and is sensitive to the Bcl-2 family member inhibitor ABT-737 (*Blood*, 2008, Vol. 111, 2300-2309). The ability of compounds to kill RS4; 11 cells is a direct measure of the compounds ability to inhibit anti-apoptotic Bcl-2 protein function. Compounds of Formula I are very effective in killing RS4; 11 cells as demonstrated by low EC<sub>50</sub> values.

40 Compounds taught in U.S. patent application Ser. No. 12/631,404, entitled "BCL-2-SELECTIVE APOPTOSIS-INDUCING AGENTS FOR THE TREATMENT OF CANCER AND IMMUNE DISEASES," filed on Dec. 4, 2009, have utility for the treatment of various cancers and autoimmune diseases due to their activity against Bcl-2 family proteins, and more specifically Bcl-2. These compounds bind to Bcl-2 with high affinity in a FRET based assay described in 45 Ser. No. 12/631,404. The administration of a one or more of these compounds to cells that are dependant on Bcl-2 or Bcl-2 family proteins for survival, such as the RS4:11 B-cell leukemia human tumor cell line, results in apoptosis, also known 50 as programmed cell death. The amount of apoptosis caused by administration of the compound is represented by the EC50 in the cell viability assay, which is a measure of the number of living cells after administration of compound.

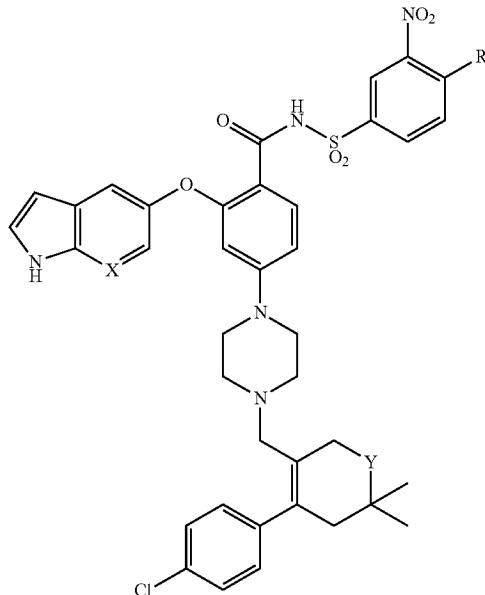

55 TABLE 4 identifies certain compounds (described below in Examples in 19, 20, 23 and 92 and described more fully in Ser. No. 12/631,404, the disclosure of which is incorporated herein by reference) with the various substituents being defined by R, X and Y as set forth. As can be seen from TABLE 4, these compounds exhibit a trend of increasing binding affinity (K<sub>i</sub>) for Bcl-2 with increasing levels of apoptosis, or cell death, in the Bcl-2 dependant tumor cell line RS4; 11. On this basis, the inventors expect that compounds with even greater affinity towards Bcl-2 than those compounds shown in Table 4 will exhibit a similar trend, potentially eliciting even greater levels of apoptosis, when administered to cells dependent on Bcl-2 for survival.

To this end, binding affinity and cellular activity for compounds according to the present invention were compared with structurally similar indole compounds. In particular, the compounds of the present invention, in which a nitrogen is contained at a specific position within the heteroarene fused to the heteroaryl ring were compared with the corresponding indole compounds, which latter compounds lack only the specific nitrogen substitution included in the compounds of the present invention.

As can be seen in TABLE 5, compounds of the present invention having the specific nitrogen substitutions shown (i.e., compounds of Examples 1, 2, 3, 4, 5, 6, 9, 10, 11, 12, 13, 15, 16, and 17, where Z=N) in fact achieve relatively greater

levels of apoptosis when administered to cells that depend on Bcl-2 for survival and have increased affinity towards Bcl-2 relative to the corresponding structural analogs lacking the specific nitrogen substitution (i.e., compounds of Examples 87, 88, 89, 90, 91, 19, 20, 21, 92, 22, 23, 93, and 94, respectively, where Z=C, taught in 9696USL2, the disclosure of which is incorporated herein by reference).

Specifically, the seventh column of TABLE 5 compares binding affinity of compounds of the present invention (the compound identified by the designated substituents in the uppermost row in each pair of rows set apart by blank rows) to corresponding compounds lacking the described nitrogen substitution. In each comparison, compounds of the present

US 9,174,982 B2

**189**

application (upper row of each pair of rows separated by a blank row) bind Bcl-2 with greater affinity to Bcl-2 than the corresponding analogs (lower row of each pair of rows separated by a blank row).

Further, column 8 of TABLE 5 compares the amount of apoptosis in the Bcl-2 dependant RS4; 11 cell line achieved using compounds of the present invention (again the compound identified by the designated substituents in the uppermost row in each pair of rows set apart by blank rows) to that achieved using compounds of Examples 87, 88, 89, 90, 91, 19, 20, 21, 92, 22, 23, 93, and 94, where Z=C. In each comparison, compounds of the present invention (upper row of each pair of rows separated by a blank row) achieve greater extent of apoptosis in Bcl-2 dependent RS4; 11 cells than the corresponding analogs (lower row of each pair of rows separated by a blank row).

**190**

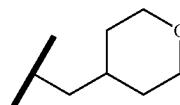

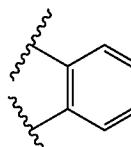

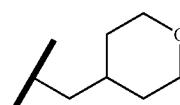

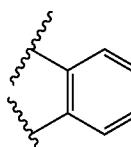

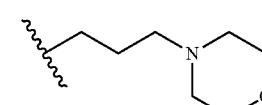

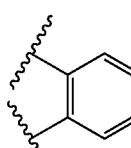

The increase in binding affinity between the compounds of the present invention and corresponding analogs ranges from 2.7 $\times$  to greater than 100 $\times$ , and the increased potency in RS4; 11 cells ranges from a 1.65 $\times$  increase to greater than 10 $\times$  increase.

As detailed below, a specific substitution of a nitrogen atom for a carbon atom leads to unexpected increase in binding affinity to antiapoptotic Bcl-2 and increase in potency in cell viability assays assessing apoptosis in Bcl-2 dependent cell lines.

This invention therefore comprises a series of compounds that demonstrate unexpected properties with respect to their binding to and inhibiting the activity of anti-apoptotic Bcl-2 protein to a significantly greater extent than corresponding analog compounds.

More specifically, compounds of the present invention contain a substitution pattern shown in the diagram below.

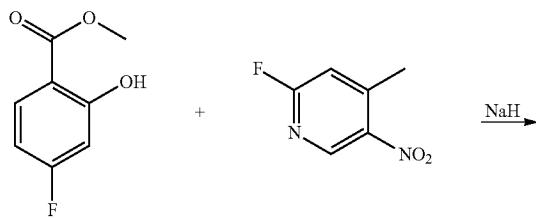

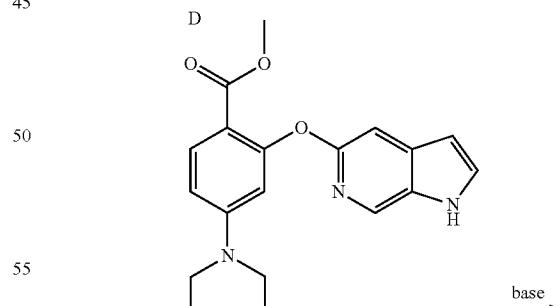

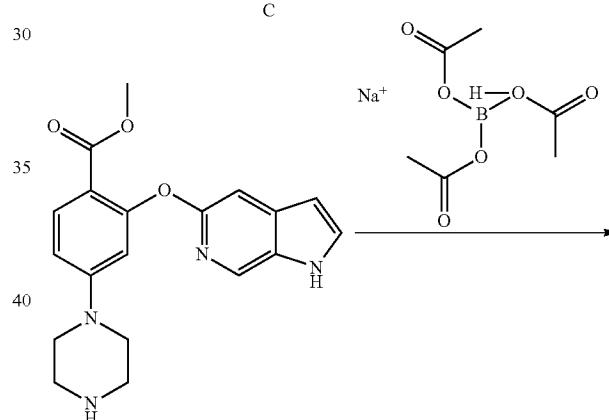

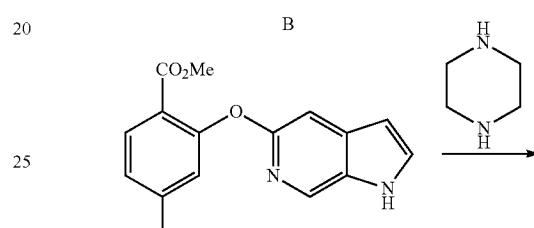

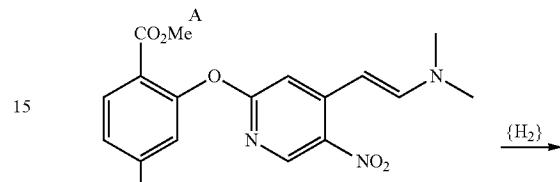

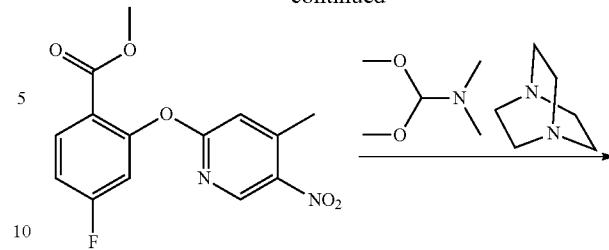

Other compounds that contain isomeric ring systems to that shown above, such as those rings systems containing a nitrogen adjacent to the oxygenated carbon within the ring, as shown below, are compromised by instability.

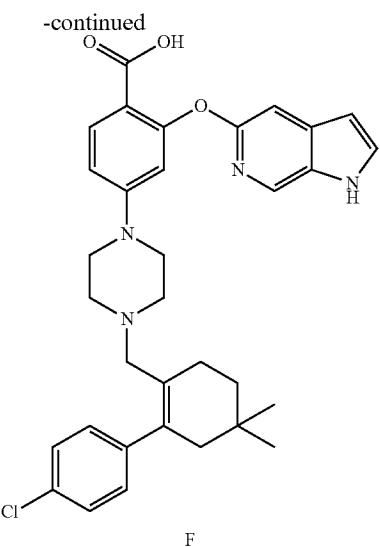

Specifically, this was discovered by the inventors in the following compound preparation. The intermediate structure F, that directly precedes the final product of the unstable compound, was prepared according to the route below. All intermediates A-F were stable and isolable using techniques known to those skilled in the art. 55

**203****204**

Intermediate F, shown in the scheme above, was reacted with intermediate G using standard coupling conditions that are known to those skilled in the art. The reaction mixture was analyzed via HPLC/MS to monitor the formation of a peak corresponding to the compound H. While this peak formed within hours of initiating the reaction below, the peak progressively disappeared during workup and chromatography, until it no longer was present. The lack of stability of the putative compound originates from the position of the nitrogen within the fused ring-system described above. This position, which is adjacent to the oxygen-bearing carbon in the 5-substituted-1H-pyrrolo[2,3-c]pyridine ring system shown below and described above, makes the compound H unstable.

It is expected that a compound containing the fused 5-substituted-1H-pyrrolo[3,2-b]pyridine ring system below would be similarly unstable, since the position of the nitrogen is adjacent to the oxygen-bearing carbon within the ring.

Therefore, compounds with the 5-substituted-1H-pyrrolo[3,2-b]pyridines are preferred over the isomeric compounds.

It is expected that, because compounds having Formula (I) bind to Bcl-2, they would also have utility as binders to anti-apoptotic proteins having close structural homology to Bcl-2, such as, for example, anti-apoptotic Bcl-X<sub>L</sub>, Bcl-w, Mcl-1 and Bfl-1/A1 proteins.

ammonia solution in methanol (3.57 mL) and stirred for 30 minutes. A small amount of solid was removed by filtration and discarded. The filtrate was concentrated, diluted with ethyl acetate, washed with water and brine, dried (MgSO<sub>4</sub>), filtered, concentrated and triturated with diethyl ether to give the product.

## Example 52B

<sup>10</sup> 3-cyano-4-((tetrahydro-2H-pyran-4-yl)methylamino)benzenesulfonamide

Into a 500 mL flame dried round-bottomed flask was added copper(I) iodide (18 g) in ether (200 mL) to give a suspension. After cooling to -5° C., methyl lithium (120 mL, 1.6M in ether) was added dropwise. After stirring at -5° C. for 1 hour, 3-methylcyclohex-2-ene (5.15 mL) in 15 mL ether was added dropwise, and the mixture was stirred at -5° C. for 1 hour. After cooling to -78° C., hexamethylphosphoramide (60 mL) was added dropwise. Ethyl carbonocyanide (23.74 mL) was added. After stirring at -78° C. for 20 minutes, the mixture was warmed up to room temperature, and stirred for 1 hour. The mixture was poured into cold water, and the layers were separated. In a 200 mL round-bottomed flask was added EXAMPLE 150C (0.97 g) and lithium borohydride (0.47 g) in ether (20 mL) to give a suspension. Methanol (2.2 mL) was added slowly. The mixture was refluxed overnight. The reaction was then cooled, and methanol was added to quench the reaction.

1N aqueous HCl was then added until the pH<7, and ether (3×30 mL) was used to extract the product. The combined organic layers were dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. The crude material was purified by flash chromatography on silica with 0-25% ethyl acetate in hexanes to provide the title compound.

After filtration, the mixture was washed with saturated aqueous NaHCO<sub>3</sub> (2×20 mL), dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. The crude product was purified by flash chromatography on silica with 0-25% ethyl acetate in hexanes to provide the title compound.

The triacetoxyborohydride gradually dissolved to give a clear solution after 5 minutes. After an additional 10 minutes, the solution became hazy. After 16 hours, the reaction was cooled to 5-10° C. Saturated aqueous NaHCO<sub>3</sub> (12 mL) was added over 5 minutes maintaining the temperature at no more than 10° C. The layers were separated and the organic layer was washed with saturated aqueous NaHCO<sub>3</sub>, and 10% NaCl (12 mL), and then filtered through Na<sub>2</sub>SO<sub>4</sub> and rinsed with dichloromethane (4 mL). The solution was concentrated on a rotovap, and chase concentrated with methanol (40 mL). The resulting solution was cooled to 5-10° C., and the product precipitated. The solution was mixed at room temperature for 30 minutes, then filtered and rinsed with methanol (5 mL), and the product was air dried.

## Example 378A

2-chloro-5-methoxy-5-methylcyclohex-1-enecarbaldehyde

Dimethylformamide (1.298 mL) in dichloromethane (2.0 mL) at -10° C. was treated dropwise with POCl<sub>3</sub> (1.426 mL) to give a colorless solution. The mixture was stirred 5 minutes and then warmed to room temperature and stirred 30 minutes. The solution was cooled to -10° C., treated dropwise with a solution of 4-methoxy-4-methylcyclohexanone (1.74 g) in dichloromethane (2.5 mL), and stirred for 4 hours at ambient temperature. The reaction mixture was poured over a mixture

of ice and 25% aqueous sodium acetate solution. After the ice melted, the reaction mixture was poured into a separatory funnel and extracted with diethyl ether (4 $\times$ 125 mL). The diethyl ether extracts were washed with NaHCO<sub>3</sub> solution and brine, dried (MgSO<sub>4</sub>), filtered and concentrated. The concentrate was chromatographed on silica gel with 0 to 5% ethyl acetate in hexanes as the eluent.

## Example 378B

2-(4-chlorophenyl)-5-methoxy-5-methylcyclohex-1-enecarbaldehyde

EXAMPLE 378A (1.55 g), 4-chlorophenylboronic acid (1.542 g), PdOAc<sub>2</sub> (0.055 g), K<sub>2</sub>CO<sub>3</sub> (2.84 g) and tetrabutylammonium bromide (2.65 g) were combined in a 50-mL round-bottomed flask equipped with a magnetic stir bar. Water (9.13 mL) was added. The vial was flushed with nitrogen, capped and stirred at 45° C. for 14 hours. The reaction mixture was cooled to room temperature and partitioned between brine and diethyl ether. The organic layer was washed with brine, dried (MgSO<sub>4</sub>), filtered through a plug of celite, concentrated and chromatographed on silica gel with 5 to 20% ethyl acetate in hexanes as the eluent.

**1****SALTS AND CRYSTALLINE FORMS OF AN APOPTOSIS-INDUCING AGENT****CROSS-REFERENCE TO RELATED APPLICATIONS**

This application claims the benefit of provisional application Ser. No. 61/416,656, filed Nov. 23, 2010, which is hereby incorporated by reference as if set forth in its entirety.

Cross-reference is also made, without claim to benefit of priority or admission as to prior art status, to the following pending U.S. application containing subject matter related to the present application: Ser. No. 12/787,682 (published as U.S. 2010/0305122) titled "Apoptosis-inducing Agents for the Treatment of Cancer and Immune and Autoimmune Diseases," the entire disclosure of which is incorporated herein by reference.

**FIELD OF THE INVENTION**

The present invention relates to salts and crystalline forms of an apoptosis-inducing agent, to pharmaceutical dosage forms comprising such salts and crystalline forms, to processes for preparing salts and crystalline forms, and to methods of use thereof for treating diseases characterized by over-expression of anti-apoptotic Bcl-2 family proteins.

**BACKGROUND OF THE INVENTION**

Overexpression of Bcl-2 proteins correlates with resistance to chemotherapy, clinical outcome, disease progression, overall prognosis or a combination thereof in various cancers and disorders of the immune system.

Evasion of apoptosis is a hallmark of cancer (Hanahan & Weinberg (2000) *Cell* 100:57-70). Cancer cells must overcome a continual bombardment by cellular stresses such as DNA damage, oncogene activation, aberrant cell cycle progression and harsh microenvironments that would cause normal cells to undergo apoptosis. One of the primary means by which cancer cells evade apoptosis is by up-regulation of anti-apoptotic proteins of the Bcl-2 family.

A particular type of neoplastic disease for which improved therapies are needed is non-Hodgkin's lymphoma (NHL). NHL is the sixth most prevalent type of new cancer in the U.S. and occurs primarily in patients 60-70 years of age. NHL is not a single disease but a family of related diseases, which are classified on the basis of several characteristics including clinical attributes and histology.

One method of classification places different histological subtypes into two major categories based on natural history of the disease, i.e., whether the disease is indolent or aggressive. In general, indolent subtypes grow slowly and are generally incurable, whereas aggressive subtypes grow rapidly and are potentially curable. Follicular lymphomas are the most common indolent subtype, and diffuse large-cell lymphomas constitute the most common aggressive subtype. The oncoprotein Bcl-2 was originally described in non-Hodgkin's B-cell lymphoma.

Treatment of follicular lymphoma typically consists of biologically-based or combination chemotherapy. Combination therapy with rituximab, cyclophosphamide, doxorubicin, vincristine and prednisone (R-CHOP) is routinely used, as is combination therapy with rituximab, cyclophosphamide, vincristine and prednisone (RCVP). Single-agent therapy with rituximab (targeting CD20, a phosphoprotein uniformly expressed on the surface of B-cells) or fludarabine

**2**

is also used. Addition of rituximab to chemotherapy regimens can provide improved response rate and increased progression-free survival.

Radioimmunotherapy agents, high-dose chemotherapy and stem cell transplants can be used to treat refractory or relapsed NHL. Currently, there is not an approved treatment regimen that produces a cure, and current guidelines recommend that patients be treated in the context of a clinical trial, even in a first-line setting.

First-line treatment of patients with aggressive large B-cell lymphoma typically consists of rituximab, cyclophosphamide, doxorubicin, vincristine and prednisone (R-CHOP), or dose-adjusted etoposide, prednisone, vincristine, cyclophosphamide, doxorubicin and rituximab (DA-EPOCH-R).

Most lymphomas respond initially to any one of these therapies, but tumors typically recur and eventually become refractory. As the number of regimens patients receive increases, the more chemotherapy-resistant the disease becomes. Average response to first-line therapy is approximately 75%, 60% to second-line, 50% to third-line, and about 35-40% to fourth-line therapy. Response rates approaching 20% with a single agent in a multiple relapsed setting are considered positive and warrant further study.

Other neoplastic diseases for which improved therapies are needed include leukemias such as chronic lymphocytic leukemia (like NHL, a B-cell lymphoma) and acute lymphocytic leukemia.

Chronic lymphoid leukemia (CLL) is the most common type of leukemia. CLL is primarily a disease of adults, more than 75% of people newly diagnosed being over the age of 50, but in rare cases it is also found in children. Combination chemotherapies are the prevalent treatment, for example fludarabine with cyclophosphamide and/or rituximab, or more complex combinations such as CHOP or R-CHOP.

Acute lymphocytic leukemia, also known as acute lymphoblastic leukemia (ALL), is primarily a childhood disease, once with essentially zero survival but now with up to 75% survival due to combination chemotherapies similar to those mentioned above. New therapies are still needed to provide further improvement in survival rates.

Current chemotherapeutic agents elicit their antitumor response by inducing apoptosis through a variety of mechanisms. However, many tumors ultimately become resistant to these agents. Bcl-2 and Bcl-X<sub>L</sub> have been shown to confer chemotherapy resistance in short-term survival assays *in vitro* and, more recently, *in vivo*. This suggests that if improved therapies aimed at suppressing the function of Bcl-2 and Bcl-X<sub>L</sub> can be developed, such chemotherapy-resistance could be successfully overcome.

Involvement of Bcl-2 proteins in bladder cancer, brain cancer, breast cancer, bone marrow cancer, cervical cancer, CLL, colorectal cancer, esophageal cancer, hepatocellular cancer, lymphoblastic leukemia, follicular lymphoma, lymphoid malignancies of T-cell or B-cell origin, melanoma, myelogenous leukemia, myeloma, oral cancer, ovarian cancer, non-small cell lung cancer, prostate cancer, small cell lung cancer, spleen cancer and the like is described in International Patent Publication Nos. WO 2005/024636 and WO 2005/049593.

Involvement of Bcl-2 proteins in immune and autoimmune diseases is described, for example, by Puck & Zhu (2003) *Current Allergy and Asthma Reports* 3:378-384; Shimazaki et al. (2000) *British Journal of Haematology* 110(3):584-590; Rengan et al. (2000) *Blood* 95(4):1283-1292; and Holzelova et al. (2004) *New England Journal of Medicine* 351(14): 1409-1418. Compounds that occupy a binding site on Bcl-2 proteins are known. To be therapeutically useful by oral administra-

methyl}piperazin-1-yl)-N-({3-nitro-4-[{(tetrahydro-2H-pyran-4-yl)methyl}amino]phenyl}sulfonyl)-2-(1H-pyrrolo[2,3-b]pyridin-5-yloxy)benzamide, and which can be depicted by the formula:

tion, such compounds desirably have high binding affinity, exhibiting for example  $K_i < 1$  nM, preferably  $< 0.1$  nM, more preferably  $< 0.01$  nM, to proteins of the Bcl-2 family, specifically Bcl-2, Bcl-X<sub>L</sub> and Bcl-w. It is further desirable that they be formulated in a manner that provides high systemic exposure after oral administration. A typical measure of systemic exposure after oral administration of a compound is the area under the curve (AUC) resulting from graphing plasma concentration of the compound versus time from oral adminis-  
25 tration.

Apoptosis-inducing drugs that target Bcl-2 family proteins such as Bcl-2 and Bcl-X<sub>L</sub> are best administered according to a regimen that provides continual, for example daily, replenishment of the plasma concentration, to maintain the concentration in a therapeutically effective range. This can be achieved by daily parenteral, e.g., intravenous (i.v.) or intra-peritoneal (i.p.) administration. However, daily parenteral administration is often not practical in a clinical setting, particularly for outpatients. To enhance clinical utility of an apoptosis-inducing agent, for example as a chemotherapeutic in cancer patients, a dosage form with acceptable oral bioavailability would be highly desirable. Such a dosage form, and a regimen for oral administration thereof, would represent an important advance in treatment of many types of cancer, including NHL, CLL and ALL, and would more readily enable combination therapies with other chemotherapeutics.  
35

Different crystalline forms of an apoptosis-inducing agent can provide different properties with respect to stability, solubility, dissolution rate, hardness, compressibility and melting point, among other physical and mechanical properties. Because ease of manufacture, formulation, storage and trans-  
50 port of an apoptosis-inducing agent is dependent on at least some of these properties, there is a need in the chemical and therapeutic arts for identification of new salts and crystalline forms of apoptosis-inducing agents and ways for reproducibly generating such salts and crystalline forms.

#### SUMMARY OF THE INVENTION

The present disclosure relates to salts and crystalline forms of an apoptosis-inducing agent, referred to herein as "Compound 1," which has the systematic name 4-(4-{[2-(4-chlorophenyl)-4,4-dimethylcyclohex-1-en-1-yl]

Following synthesis of Compound 1, as described herein, the product may be recovered as a powder in an amorphous state. An amorphous form of Compound 1 may not be well suited for use as an active pharmaceutical ingredient (API) for various types of downstream formulations. More particularly, an amorphous form of Compound 1 can be difficult and therefore expensive to purify and can present process control problems.  
30

The present disclosure provides a series of novel salts and crystalline forms of Compound 1 suitable for use as API in a wide variety of formulation types, including those where the API is present in particulate form together with excipients, for example in orally deliverable tablets or capsules. The salts and crystalline forms of Compound 1 may also be useful where the crystalline form is converted to a non-crystalline form (e.g., solution or amorphous form) when formulated.  
35

Also included are ways to prepare the salts and crystalline forms of Compound 1. Salt and crystalline forms of Compound 1 can be used to modulate and/or improve the physicochemical properties of the API, including solid state properties (e.g., crystallinity, hygroscopicity, melting point, hydration potential, polymorphism, etc.), pharmaceutical properties (e.g., solubility/dissolution rate, stability, compatibility, etc.), and crystallization characteristics (e.g., purity, yield, morphology, etc.), as non-limiting examples.  
40

In some embodiments, the salt or crystalline form of Compound 1 includes those of Compound 1 free base anhydrate having PXRD pattern A, Compound 1 free base anhydrate having PXRD pattern B, Compound 1 free base hydrate having PXRD pattern C, Compound 1 free base hydrate having PXRD pattern D, Compound 1 free base dichloromethane solvate having pattern E, Compound 1 free base ethyl acetate solvate having PXRD pattern F, Compound 1 free base ethyl acetate solvate having PXRD pattern G, Compound 1 free base acetonitrile solvate having PXRD pattern H, Compound 1 free base acetonitrile solvate having PXRD pattern I, Compound 1 free base acetone solvate having PXRD pattern J, Compound 1 hydrochloride having PXRD pattern K, Compound 1 hydrochloride hydrate having PXRD pattern L, Compound 1 sulfate having PXRD pattern M, and Compound 1 free base tetrahydrofuran (THF) solvate having PXRD pattern N, each having the respective powder X-ray diffraction patterns as described herein.

## DETAILED DESCRIPTION

The term “free base” is used for convenience herein to refer to Compound 1 parent compound as distinct from any salt thereof, while recognizing that the parent compound, strictly speaking, is zwitterionic at neutral conditions and thus does not always behave as a true base.

An apoptosis-inducing agent, referred to herein as Compound 1, has the systematic name 4-(4-{[2-(4-chlorophenyl)-4,4-dimethylcyclohex-1-en-1-yl]methyl}piperazin-1-yl)-N-({3-nitro-4-[{(tetrahydro-2H-pyran-4-yl)methyl}amino]phenyl}sulfonyl)-2-(1H-pyrrolo[2,3-b]pyridin-5-yloxy)benzamide, and can be depicted by the formula:

60

solvents, and administering the resulting solution or dispersion in a therapeutically effective amount to a subject having the disease.

Additional embodiments of the invention, including particular aspects of those provided above, will be found in, or will be evident from, the detailed description that follows.

In various embodiments, salts and crystalline forms of Compound 1 are provided. Crystalline forms include solvates, hydrates, and salts of Compound 1.

65 In contrast to an amorphous form of Compound 1 free base and an amorphous form of a Compound 1 salt, a crystalline form is characterized by the presence of observable peaks in a powder x-ray diffraction (PXRD) pattern measured on the

US 8,722,657 B2

7

crystalline form. For crystalline forms prepared to yield suitably sized single-crystals, the crystalline form can be further characterized through an experimental determination of the unit cell parameters, the identification of the crystallographic space group to which a single crystal belongs, or both of these. Once the unit cell parameters are known, the location of the diffraction peaks, and in particular the  $2\theta$  values of the peaks in a PXRD pattern can be calculated, to further characterize the crystalline form. Of course, the PXRD pattern can also be measured experimentally for such crystalline forms. If not only the cell parameters but a three dimensional single crystal structure is known, then not only the positions but also the intensity of the peaks in the diffraction pattern can be calculated in further characterization of the crystalline form.

The PXRD patterns measured or calculated for the salts and crystalline forms reported herein represent a fingerprint that can be compared to other experimentally determined patterns to find a match. Identity of the respective crystalline forms is established by overlap or match of an experimentally determined PXRD pattern with the PXRD pattern of the crystalline forms reported herein. In various embodiments, the salts and crystalline forms are characterized by exhibiting at least one of the PXRD peaks reported here. Thus, in various embodiments, a salt or crystalline form is characterized by a match of two or more peaks, a match of 3 or more peaks, 4 or more peaks, or 5 or more peaks, and so on, from the respective PXRD patterns.

An embodiment of the synthesis of Compound 1 (free base) and representative intermediate compounds is presented below. The exemplified compounds are named using ACD/ChemSketch Version 5.06 (5 Jun. 2001, Advanced Chemistry Development Inc., Toronto, Ontario), ACD/ChemSketch Version 12.01 (13 May 2009), Advanced Chemistry Development Inc., Toronto, Ontario), or ChemDraw® Ver. 9.0.5 (CambridgeSoft, Cambridge, Mass.). Intermediates are named using ChemDraw® Ver. 9.0.5 (CambridgeSoft, Cambridge, Mass.).

PXRD data were collected using a G3000 diffractometer (Inel Corp., Artenay, France) equipped with a curved position-sensitive detector and parallel-beam optics. The diffractometer was operated with a copper anode tube (1.5 kW fine focus) at 40 kV and 30 mA. An incident-beam germanium monochromator provided monochromatic radiation Cu—K $\alpha$  radiation, which has a wavelength of 1.54178 Å. The diffractometer was calibrated using the attenuated direct beam at one-degree intervals. Calibration was checked using a silicon powder line position reference standard (NIST 640c). The instrument was computer-controlled using Symphonix software (Inel Corp., Artenay, France) and the data were analyzed using Jade software (version 6.5, Materials Data, Inc., Liver-

5 In some embodiments, the percent crystallinity of any of the salt or crystalline forms of Compound 1 described herein can vary with respect to the total amount of Compound 1. In particular, certain embodiments provide for the percent crystallinity of a salt or crystalline form of Compound 1 being at least 10%, at least 20%, at least 30%, at least 40%, at least 50%, at least 60%, at least 70%, at least 80%, at least 90%, at least 95%, or at least 99%. In some embodiments, the percent crystallinity can be substantially 100%, where substantially 100% indicates that the entire amount of Compound 1 appears to be crystalline as best can be determined using methods known in the art. Accordingly, pharmaceutical compositions and therapeutically effective amounts of Compound 1 can include amounts that vary in crystallinity. These include 10 instances where Compound 1 is used as API in various formulations and solid forms, including where an amount of Compound 1 in a solid form is subsequently dissolved, partially dissolved, or suspended or dispersed in a liquid.

As noted, in some embodiments API compositions are 15 provided that comprise Compound 1, wherein at least a portion of the Compound 1 in the API composition is in one of the salt or crystalline forms. For example, an API composition containing Compound 1 has at least 10%, at least 20%, at least 30%, at least 40%, at least 50%, at least 60%, at least 70%, at least 80%, at least 90%, at least 95% or at least 99% of the compound of the composition in one of the salt or crystalline forms. In some embodiments, essentially 100% of the Compound 1 of an API formulation is in a salt or crystalline form as described herein.

20 Any of the crystalline forms of Compound 1, including salts and solvated forms, can be useful as an active pharmaceutical ingredient (API) for preparation of pharmaceutical compositions. However, solvent-free forms are generally preferred for this purpose. A hydrate is considered solvent-free 25 for this purpose. Solvated forms can be, as indicated above, useful as process intermediates in preparation of solvent-free forms. Compound 1 salts and crystalline forms can be used in preparation of pharmaceutical compositions suitable for various routes of administration, including oral, to a subject in 30 need thereof. Thus, in some embodiments, a pharmaceutical composition is provided, comprising a crystalline form of Compound 1 and one or more pharmaceutically acceptable excipients. Such compositions can be prepared using various known processes of pharmacy.

25 In some embodiments, the salt or crystalline form of Compound 1 includes those of Compound 1 free base anhydrate having PXRD pattern A, Compound 1 free base anhydrate having PXRD pattern B, Compound 1 free base hydrate having PXRD pattern C, Compound 1 free base hydrate having PXRD pattern D, Compound 1 free base dichloromethane solvate having pattern E, Compound 1 free base ethyl acetate solvate having PXRD pattern F, Compound 1 free base ethyl acetate solvate having PXRD pattern G, Compound 1 free base acetonitrile solvate having PXRD pattern H, Compound 30 1 free base acetonitrile solvate having PXRD pattern I, Compound 1 free base acetone solvate having PXRD pattern J, Compound 1 hydrochloride having PXRD pattern K, Compound 1 hydrochloride hydrate having PXRD pattern L, Compound 1 sulfate having PXRD pattern M, and Compound 35 1 free base tetrahydrofuran (THF) solvate having PXRD pattern N, each having the respective powder X-ray diffraction patterns as described herein.

According to any of these embodiments, the composition can be deliverable, for example, by the oral route. Other routes of administration include without limitation parenteral, sublingual, buccal, intranasal, pulmonary, topical, transdermal, intradermal, ocular, otic, rectal, vaginal, intra-gastric, intracranial, intrasynovial and intra-articular routes.

Where it is desired to provide Compound 1 free base or salt in solution form, for example in a liquid formulation for oral or parenteral administration, the Compound 1 free base or salt will not, of course, be present in such a formulation in crystalline form; indeed, the presence of crystals is generally undesired in such a formulation. However, a crystalline form of Compound 1 free base can nonetheless be important as API in a process for preparing such a formulation. Thus, the present disclosure further provides a process for preparing a pharmaceutical solution composition of Compound 1 comprising dissolving a crystalline salt or a crystalline form of Compound 1 free base in a pharmaceutically acceptable solvent or mixture of solvents. Even where the desired formulation is one containing Compound 1 free base in amorphous form, for example a solid melt formulation, a crystalline form of Compound 1 free base can still be useful as API in a process for preparing such a formulation.

As API, a crystalline form of Compound 1 free base or mixtures thereof can have advantages over an amorphous form. For example, purification of API to the high degree of purity required by most regulatory authorities can be more efficient and therefore cost less where the API is in crystalline form as opposed to amorphous form. Physical and chemical stability, and therefore shelf-life of the API solid, can also be better for crystalline than amorphous forms. Ease of handling can be improved over the amorphous form, which can be oily or sticky. Drying can be more straightforward and more easily controlled in the case of the crystalline material, which can have a well-defined drying or desolvation temperature, than in the case of the amorphous material, which can have greater affinity for organic solvents and no well-defined drying temperature. Downstream processing using crystalline API can further permit enhanced process control. In preparing a liquid formulation, for example a solution in a lipid carrier, crystalline Compound 1 can dissolve faster and can have a reduced tendency to form a gel during dissolution. These advantages are illustrative and non-limiting.

Pharmaceutical compositions comprising crystalline Compound 1 free base, or prepared using crystalline Compound 1 free base or salts of Compound 1 as API, contain Compound 1 in an amount that can be therapeutically effective when the composition is administered to a subject in need thereof according to an appropriate regimen. Dosage amounts are expressed herein as free base equivalent amounts unless the context requires otherwise. Typically, a unit dose (the amount administered at a single time), which can be administered at an appropriate frequency, e.g., twice daily to once weekly, is about 10 to about 1,000 mg. Where frequency of administration is once daily (q.d.), unit dose and daily dose are the same. Illustratively, the unit dose of Compound 1 in a composition of the invention can be about 25 to about 1,000 mg, more typically about 50 to about 500 mg, for example about 50, about 100, about 150, about 200, about 250, about 300, about 350, about 400, about 450 or about 500 mg. Where the composition is prepared as a discrete dosage form such as a tablet or capsule, a unit dose can be deliverable in a single dosage form or a small plurality of dosage forms, most typically 1 to about 10 dosage forms.

The higher the unit dose, the more desirable it becomes to select excipients that permit a relatively high loading of API (in this case Compound 1 free base or salt) in the formulation.

22

Typically, the concentration of Compound 1 in a formulation prepared according to the present disclosure is at least about 1%, e.g., about 1% to about 25%, by weight, but lower and higher concentrations can be acceptable or achievable in specific cases. Illustratively, the Compound 1 free base equivalent concentration in various embodiments is at least about 2%, e.g., about 2% to about 20%, by weight, for example about 5%, about 10% or about 15%, by weight of the formulation.

10 A composition prepared according to the invention comprises, in addition to the API, one or more pharmaceutically acceptable excipients. If the composition is to be prepared in solid form for oral administration, for example as a tablet or capsule, it typically includes at least one or more solid diluents and one or more solid disintegrants. Optionally, the excipients further include one or more binding agents, wetting agents and/or antifrictional agents (lubricants, anti-adherents and/or glidants). Many excipients have two or more functions in a pharmaceutical composition. Characterization 15 herein of a particular excipient as having a certain function, e.g., diluent, disintegrant, binding agent, etc., should not be read as limiting to that function. Further information on excipients can be found in standard reference works such as *Handbook of Pharmaceutical Excipients*, 3rd ed. (Kibbe, ed. 20 (2000), Washington: American Pharmaceutical Association).

Suitable diluents illustratively include, either individually or in combination, lactose, including anhydrous lactose and lactose monohydrate; lactitol; maltitol; mannitol; sorbitol; xylitol; dextrose and dextrose monohydrate; fructose; 30 sucrose and sucrose-based diluents such as compressible sugar, confectioner's sugar and sugar spheres; maltose; inositol; hydrolyzed cereal solids; starches (e.g., corn starch, wheat starch, rice starch, potato starch, tapioca starch, etc.), starch components such as amylose and dextrans, and modified or processed starches such as pregelatinized starch; dextrins; celluloses including powdered cellulose, microcrystalline cellulose, silicified microcrystalline cellulose, food grade sources of  $\alpha$ - and amorphous cellulose and powdered cellulose, and cellulose acetate; calcium salts including calcium 35 carbonate, tribasic calcium phosphate, dibasic calcium phosphate dihydrate, monobasic calcium sulfate monohydrate, calcium sulfate and granular calcium lactate trihydrate; magnesium carbonate; magnesium oxide; bentonite; kaolin; sodium chloride; and the like. Such diluents, if present, typically constitute in total about 5% to about 95%, for example about 20% to about 90%, or about 50% to about 85%, by weight of the composition. The diluent or diluents selected 40 preferably exhibit suitable flow properties and, where tablets are desired, compressibility.

Microcrystalline cellulose and silicified microcrystalline cellulose are particularly useful diluents, and are optionally used in combination with a water-soluble diluent such as mannitol. Illustratively, a suitable weight ratio of microcrystalline cellulose or silicified microcrystalline cellulose to mannitol is about 10:1 to about 1:1, but ratios outside this range can be useful in particular circumstances.

Suitable disintegrants include, either individually or in combination, starches including pregelatinized starch and sodium starch glycolate; clays; magnesium aluminum silicate; cellulose-based disintegrants such as powdered cellulose, microcrystalline cellulose, methylcellulose, low-substituted hydroxypropylcellulose, carmellose, carmellose calcium, carmellose sodium and croscarmellose sodium; alginates; povidone; crospovidone; polacrilin potassium; 60 gums such as agar, guar, locust bean, karaya, pectin and tragacanth gums; colloidal silicon dioxide; and the like. One or more disintegrants, if present, typically constitute in total

23

about 0.2% to about 30%, for example about 0.5% to about 20%, or about 1% to about 10%, by weight of the composition.

Sodium starch glycolate is a particularly useful disintegrant, and typically constitutes in total about 1% to about 20%, for example about 2% to about 15%, or about 5% to about 10%, by weight of the composition.

Binding agents or adhesives are useful excipients, particularly where the composition is in the form of a tablet. Such binding agents and adhesives should impart sufficient cohesion to the blend being tableted to allow for normal processing operations such as sizing, lubrication, compression and packaging, but still allow the tablet to disintegrate and the composition to be absorbed upon ingestion. Suitable binding agents and adhesives include, either individually or in combination, acacia; tragacanth; glucose; polydextrose; starch including pregelatinized starch; gelatin; modified celluloses including methylcellulose, carmellose sodium, hydroxypropylmethylcellulose (HPMC), hydroxypropylcellulose, hydroxyethylcellulose and ethylcellulose; dextrins including maltodextrin; zein; alginic acid and salts of alginic acid, for example sodium alginate; magnesium aluminum silicate; bentonite; polyethylene glycol (PEG); polyethylene oxide; guar gum; polysaccharide acids; polyvinylpyrrolidone (povidone or PVP), for example povidone K-15, K-30 and K-29/32; polyacrylic acids (carbomers); polymethacrylates; and the like. One or more binding agents and/or adhesives, if present, typically constitute in total about 0.5% to about 25%, for example about 1% to about 15%, or about 1.5% to about 10%, by weight of the composition.

Povidone and hydroxypropylcellulose, either individually or in combination, are particularly useful binding agents for tablet formulations, and, if present, typically constitute about 0.5% to about 15%, for example about 1% to about 10%, or about 2% to about 8%, by weight of the composition.

Wetting agents, if present, are normally selected to maintain the drug in close association with water, a condition that can improve bioavailability of the composition. Non-limiting examples of surfactants that can be used as wetting agents include, either individually or in combination, quaternary ammonium compounds, for example benzalkonium chloride, benzethonium chloride and cetylpyridinium chloride; dioctyl sodium sulfosuccinate; polyoxyethylene alkylphenyl ethers, for example nonoxynol 9, nonoxynol 10 and octoxynol 9; poloxamers (polyoxyethylene and polyoxypropylene block copolymers); polyoxyethylene fatty acid glycerides and oils, for example polyoxyethylene (8) caprylic/capric mono- and diglycerides, polyoxyethylene (35) castor oil and polyoxyethylene (40) hydrogenated castor oil; polyoxyethylene alkyl ethers, for example ceteth-10, laureth-4, laureth-23, oleth-2, oleth-10, oleth-20, steareth-2, steareth-10, steareth-20, steareth-100 and polyoxyethylene (20) cetostearyl ether; polyoxyethylene fatty acid esters, for example polyoxyethylene (20) stearate, polyoxyethylene (40) stearate and polyoxyethylene (100) stearate; sorbitan esters, for example sorbitan monolaurate, sorbitan monooleate, sorbitan monopalmitate and sorbitan monostearate; polyoxyethylene sorbitan esters, for example polysorbate 20 and polysorbate 80; propylene glycol fatty acid esters, for example propylene glycol laurate; sodium lauryl sulfate; fatty acids and salts thereof, for example oleic acid, sodium oleate and triethanolamine oleate; glyceryl fatty acid esters, for example glyceryl monooleate, glyceryl monostearate and glyceryl palmitostearate; tyloxapol; and the like. One or more wetting agents, if present, typically constitute in total about 0.1% to about 15%, for example about 0.2% to about 10%, or about 0.5% to about 7%, by weight of the composition.

24

Nonionic surfactants, more particularly poloxamers, are examples of wetting agents that can be useful herein. Illustratively, a poloxamer such as Pluronic™ F127, if present, can constitute about 0.1% to about 10%, for example about 0.2% to about 7%, or about 0.5% to about 5%, by weight of the composition.

Lubricants reduce friction between a tableting mixture and tableting equipment during compression of tablet formulations. Suitable lubricants include, either individually or in combination, glyceryl behenate; stearic acid and salts thereof, including magnesium, calcium and sodium stearates; hydrogenated vegetable oils; glyceryl palmitostearate; talc; waxes; sodium benzoate; sodium acetate; sodium fumarate; sodium stearyl fumarate; PEGs (e.g., PEG 4000 and PEG 6000); poloxamers; polyvinyl alcohol; sodium oleate; sodium lauryl sulfate; magnesium lauryl sulfate; and the like. One or more lubricants, if present, typically constitute in total about 0.05% to about 10%, for example about 0.1% to about 5%, or about 0.2% to about 2%, by weight of the composition. Sodium stearyl fumarate is a particularly useful lubricant.

Anti-adherents reduce sticking of a tablet formulation to equipment surfaces. Suitable anti-adherents include, either individually or in combination, talc, colloidal silicon dioxide, starch, DL-leucine, sodium lauryl sulfate and metallic stearates. One or more anti-adherents, if present, typically constitute in total about 0.05% to about 10%, for example about 0.1% to about 7%, or about 0.2% to about 5%, by weight of the composition. Colloidal silicon dioxide is a particularly useful anti-adherent.

Glidants improve flow properties and reduce static in a tableting mixture. Suitable glidants include, either individually or in combination, colloidal silicon dioxide, starch, powdered cellulose, sodium lauryl sulfate, magnesium trisilicate and metallic stearates. One or more glidants, if present, typically constitute in total about 0.05% to about 10%, for example about 0.1% to about 7%, or about 0.2% to about 5%, by weight of the composition. Colloidal silicon dioxide is a particularly useful glidant.

Other excipients such as buffering agents, stabilizers, antioxidants, antimicrobials, colorants, flavors and sweeteners are known in the pharmaceutical art and can be used in compositions of the present invention. Tablets can be uncoated or can comprise a core that is coated, for example with a non-functional film or a release-modifying or enteric coating. Capsules can have hard or soft shells comprising, for example, gelatin (in the form of hard gelatin capsules or soft elastic gelatin capsules), starch, carrageenan and/or HPMC, optionally together with one or more plasticizers.

A solid orally deliverable composition of the present invention is not limited by any process used to prepare it. Any suitable process of pharmacy can be used, including dry blending with or without direct compression, and wet or dry granulation.

If the composition is to be prepared in liquid (including encapsulated liquid) form, the API (e.g., crystalline Compound 1 free base or salt) can be, for example, dissolved in a suitable carrier, typically one comprising a lipid solvent for the API. The higher the unit dose, the more desirable it becomes to select a carrier that permits a relatively high concentration of the drug in solution therein. Typically, the free base equivalent concentration of API in the carrier is at least about 10 mg/ml, e.g., about 10 to about 500 mg/ml, but lower and higher concentrations can be acceptable or achievable in specific cases. Illustratively, the drug concentration in various embodiments is at least about 10 mg/ml, e.g., about 10 to about 250 mg/ml, or at least about 20 mg/ml, e.g., about

## US 8,722,657 B2

25

20 to about 200 mg/ml, for example about 20, about 25, about 30, about 40, about 50, about 75, about 100 or about 150 mg/ml.

The carrier can be substantially non-aqueous, i.e., having no water, or having an amount of water that is small enough to be, in practical terms, essentially non-deleterious to performance or properties of the composition. Typically, the carrier comprises zero to less than about 5% by weight water. It will be understood that certain ingredients useful herein can bind small amounts of water on or within their molecules or supramolecular structures; such bound water if present does not affect the "substantially non-aqueous" character of a carrier as defined herein.

In some embodiments, the carrier comprises one or more glyceride materials. Suitable glyceride materials include, without limitation, medium to long chain mono-, di- and triglycerides. The term "medium chain" herein refers to hydrocarbyl chains individually having no less than about 6 and less than about 12 carbon atoms, including for example C<sub>8</sub> to C<sub>10</sub> chains. Thus glyceride materials comprising caprylyl and capryl chains, e.g., caprylic/capric mono-, di- and/or triglycerides, are examples of "medium chain" glyceride materials herein. The term "long chain" herein refers to hydrocarbyl chains individually having at least about 12, for example about 12 to about 18, carbon atoms, including for example lauryl, myristyl, cetyl, stearyl, oleyl, linoleyl and linolenyl chains. Medium to long chain hydrocarbyl groups in the glyceride materials can be saturated, mono- or polyunsaturated.

In one embodiment the carrier comprises a medium chain and/or a long chain triglyceride material. A suitable example of a medium chain triglyceride material is a caprylic/capric triglyceride product such as, for example, Captex 355 EPT<sup>TM</sup> of Abitec Corp. and products substantially equivalent thereto. Suitable examples of long chain triglycerides include any pharmaceutically acceptable vegetable oil, for example canola, coconut, corn, cottonseed, flaxseed, olive, palm, peanut, safflower, sesame, soy and sunflower oils, and mixtures of such oils. Oils of animal, particularly marine animal, origin can also be used, including for example fish oil.

In some embodiments the carrier comprises a phospholipid and a pharmaceutically acceptable solubilizing agent for the phospholipid. It will be understood that reference in the singular to a (or the) phospholipid, solubilizing agent or other formulation ingredient herein includes the plural; thus combinations, for example mixtures, of more than one phospholipid, or more than one solubilizing agent, are expressly contemplated herein. The solubilizing agent, or the combination of solubilizing agent and phospholipid, also solubilizes the drug, although other carrier ingredients, such as a surfactant or an alcohol such as ethanol, optionally present in the carrier can in some circumstances provide enhanced solubilization of the drug.

Any pharmaceutically acceptable phospholipid or mixture of phospholipids can be used. In general such phospholipids are phosphoric acid esters that yield on hydrolysis phosphoric acid, fatty acid(s), an alcohol and a nitrogenous base. Pharmaceutically acceptable phospholipids can include without limitation phosphatidylcholines, phosphatidylserines and phosphatidylethanolamines. In one embodiment the composition comprises phosphatidylcholine, derived for example from natural lecithin. Any source of lecithin can be used, including animal sources such as egg yolk, but plant sources are generally preferred. Soy is a particularly rich source of lecithin that can provide phosphatidylcholine for use in the present invention.

26

Illustratively, a suitable amount of phospholipid is about 15% to about 75%, for example about 30% to about 60%, by weight of the carrier, although greater and lesser amounts can be useful in particular situations.

5 Ingredients useful as components of the solubilizing agent are not particularly limited and will depend to some extent on the desired concentration of drug and of phospholipid. In one embodiment, the solubilizing agent comprises one or more glycols and/or one or more glyceride materials.

10 Suitable glycols include propylene glycol and polyethylene glycols (PEGs) having molecular weight of about 200 to about 1,000 g/mol, e.g., PEG-400, which has an average molecular weight of about 400 g/mol. Such glycols can provide relatively high solubility of the drug; however the potential for oxidative degradation of the drug can be increased when in solution in a carrier comprising such glycols, for example because of the tendency of glycols to produce super-oxides, peroxides and/or free hydroxyl radicals. general, suitable amounts of ethanol are 0% to about 25%, for example about 1% to about 20% or about 3% to about 15%, by weight of the carrier.

Optionally, the carrier further comprises a pharmaceutically acceptable non-phospholipid surfactant. One of skill in the art will be able to select a suitable surfactant for use in a composition of the invention. Illustratively, a surfactant such as polysorbate 80 can be included in an amount of 0% to about 5%, for example 0% to about 2% or 0% to about 1%, by weight of the carrier.

Conveniently, pre-blended products are available containing a suitable phospholipid+solubilizing agent combination for use in compositions of the present invention. Pre-blended phospholipid+solubilizing agent products can be advantageous in improving ease of preparation of the present compositions.

An illustrative example of a pre-blended phospholipid+solubilizing agent product is Phosal 50 PG<sup>TM</sup>, available from Phospholipid GmbH, Germany, which comprises, by weight, not less than 50% phosphatidylcholine, not more than 6% lysophosphatidylcholine, about 35% propylene glycol, about 3% mono- and diglycerides from sunflower oil, about 2% soy fatty acids, about 2% ethanol, and about 0.2% ascorbyl palmitate.

Another illustrative example is Phosal 53 MCT<sup>TM</sup>, also available from Phospholipid GmbH, which contains, by weight, not less than 53% phosphatidylcholine, not more than 6% lysophosphatidylcholine, about 29% medium chain triglycerides, 3-6% (typically about 5%) ethanol, about 3% mono- and diglycerides from sunflower oil, about 2% oleic acid, and about 0.2% ascorbyl palmitate (reference composition). A product having the above or substantially equivalent composition, whether sold under the Phosal 53 MCT<sup>TM</sup> brand or otherwise, is generically referred to herein as "phosphatidylcholine+medium chain triglycerides 53/29". A product having "substantially equivalent composition" in the present context means having a composition sufficiently similar to the reference composition in its ingredient list and relative amounts of ingredients to exhibit no practical difference in properties with respect to utilization of the product herein.

Yet another illustrative example is Phosal 50 SA+<sup>TM</sup>, also available from Phospholipid GmbH, which contains, by weight, not less than 50% phosphatidylcholine and not more than 6% lysophosphatidylcholine in a solubilizing system comprising safflower oil and other ingredients.

The phosphatidylcholine component of each of these pre-blended products can be derived from soy lecithin. Products of substantially equivalent composition may be obtainable from other suppliers.

A pre-blended product such as Phosal 50 PG<sup>TM</sup>, Phosal 53 MCT<sup>TM</sup> or Phosal 50 SA+<sup>TM</sup> can, in some embodiments, constitute substantially the entire carrier system. In other embodiments, additional ingredients are present, for example ethanol (additional to any that may be present in the pre-blended product), non-phospholipid surfactant such as polysorbate 80, polyethylene glycol and/or other ingredients. Such additional ingredients, if present, are typically included in only minor amounts. Illustratively, phosphatidylcholine+medium chain triglycerides 53/29 can be included in the carrier in an amount of about 50% to 100%, for example about 80% to 100%, by weight of the carrier.

Without being bound by theory, it is believed that the therapeutic efficacy of Compound 1 is due at least in part to its ability to bind to a Bcl-2 family protein such as Bcl-2, Bcl-X<sub>L</sub> or Bcl-w in a way that inhibits the anti-apoptotic action of the protein, for example by occupying the BH3 binding groove of the protein.

28

In still further embodiments of the invention, there is provided a method for treating a disease characterized by apoptotic dysfunction and/or overexpression of an anti-apoptotic Bcl-2 family protein, comprising administering to a subject having the disease a therapeutically effective amount of crystalline Compound 1 free base or a pharmaceutical composition comprising a salt or crystalline form of Compound 1 free base and one or more pharmaceutically acceptable excipients.

In still further embodiments of the invention, there is provided a method for treating a disease characterized by apoptotic dysfunction and/or overexpression of an anti-apoptotic Bcl-2 family protein is provided, where the method comprises preparing a solution or dispersion of a salt or crystalline form of Compound 1 described herein in a pharmaceutically acceptable solvent or mixture of solvents, and administering the resulting solution or dispersion in a therapeutically effective amount to a subject having the disease.

The subject can be human or non-human (e.g., a farm, zoo, work or companion animal, or a laboratory animal used as a model) but in an important embodiment the subject is a human patient in need of the drug, for example to treat a disease characterized by apoptotic dysfunction and/or overexpression of an anti-apoptotic Bcl-2 family protein. A human subject can be male or female and of any age, but is typically an adult.

The composition is normally administered in an amount providing a therapeutically effective daily dose of the drug. The term "daily dose" herein means the amount of drug administered per day, regardless of the frequency of administration. For example, if the subject receives a unit dose of 150 mg twice daily, the daily dose is 300 mg. Use of the term "daily dose" will be understood not to imply that the specified dosage amount is necessarily administered once daily. However, in a particular embodiment the dosing frequency is once daily (q.d.), and the daily dose and unit dose are in this embodiment the same thing.

What constitutes a therapeutically effective dose depends on the bioavailability of the particular formulation, the subject (including species and body weight of the subject), the disease (e.g., the particular type of cancer) to be treated, the stage and/or severity of the disease, the individual subject's tolerance of the compound, whether the compound is administered in monotherapy or in combination with one or more other drugs, e.g., other chemotherapeutics for treatment of cancer, and other factors. Thus, the daily dose can vary within wide margins, for example from about 10 to about 1,000 mg. Greater or lesser daily doses can be appropriate in specific situations. It will be understood that recitation herein of a "therapeutically effective" dose herein does not necessarily require that the drug be therapeutically effective if only a single such dose is administered; typically therapeutic efficacy depends on the composition being administered repeatedly according to a regimen involving appropriate frequency and duration of administration. It is strongly preferred that, while the daily dose selected is sufficient to provide benefit in terms of treating the cancer, it should not be sufficient to provoke an adverse side-effect to an unacceptable or intolerable degree. A suitable therapeutically effective dose can be selected by the physician of ordinary skill without undue experimentation based on the disclosure herein and on art cited herein, taking into account factors such as those mentioned above. The physician may, for example, start a cancer patient on a course of therapy with a relatively low daily dose and titrate the dose upwards over a period of days or weeks, to reduce risk of adverse side-effects.

Illustratively, suitable doses of Compound 1 are generally about 25 to about 1000 mg/day or about 50 to about 1000

mg/day, more typically about 50 to about 500 mg/day or about 200 to about 400 mg/day, for example about 50, about 100, about 150, about 200, about 250, about 300, about 350, about 400, about 450, about 500, about 750 or about 1000 mg/day, administered at an average dosage interval of about 3 hours to about 7 days, for example about 8 hours to about 3 days, or about 12 hours to about 2 days. In most cases a once-daily (q.d.) administration regimen is suitable.

In certain embodiments, the invention relates to a method for treating a disease characterized by apoptotic dysfunction and/or overexpression of an anti-apoptotic Bcl-2 family protein, comprising administering to a subject having the disease a therapeutically effective amount of (a) Compound 1 in a salt or crystalline form or (b) a pharmaceutical composition comprising Compound 1 in a salt or crystalline form and one or more pharmaceutically acceptable excipients, wherein the therapeutically effective amount is administered orally in a dose of about 50 to about 1000 mg Compound 1 per day at an average treatment interval of about 3 hours to about 7 days.

In certain embodiments, the invention relates to a method for treating a disease characterized by apoptotic dysfunction and/or overexpression of an anti-apoptotic Bcl-2 family protein, comprising administering to a subject having the disease a therapeutically effective amount of (a) Compound 1 in a salt or crystalline form or (b) a pharmaceutical composition comprising Compound 1 in a salt or crystalline form and one or more pharmaceutically acceptable excipients, wherein the therapeutically effective amount is administered orally once daily in a dose of about 200 to about 400 mg Compound 1 free base equivalent per day.

In certain embodiments, the invention relates to a method for treating a disease characterized by apoptotic dysfunction and/or overexpression of an anti-apoptotic Bcl-2 family protein, comprising administering a solution or dispersion of Compound 1 in a salt or crystalline form to a subject having the disease, wherein the solution is administered orally in a dose of about 50 to about 1000 mg Compound 1 per day at an average treatment interval of about 3 hours to about 7 days.

In certain embodiments, the invention relates to a method for treating a disease characterized by apoptotic dysfunction and/or overexpression of an anti-apoptotic Bcl-2 family protein, comprising administering a solution or dispersion of Compound 1 in a salt or crystalline form to a subject having the disease, wherein the solution is administered orally once daily in a dose of about 200 to about 400 mg Compound 1 free base equivalent per day.

An “average dosage interval” herein is defined as a span of time, for example one day or one week, divided by the number of unit doses administered over that span of time. For example, where a drug is administered three times a day, around 8 am, around noon and around 6 pm, the average dosage interval is 8 hours (a 24-hour time span divided by 3). If the drug is formulated as a discrete dosage form such as a tablet or capsule, a plurality (e.g., 2 to about 10) of dosage forms administered at one time is considered a unit dose for the purpose of defining the average dosage interval.

Compositions prepared according to the present invention are suitable for use in monotherapy or in combination therapy, for example with other chemotherapeutics or with ionizing radiation. A particular advantage of the present invention is that it permits once-daily oral administration, a regimen which is convenient for the patient who is undergoing treatment with other orally administered drugs on a once-daily regimen. Oral administration is easily accomplished by the patient him/herself or by a caregiver in the patient’s home; it is also a convenient route of administration for patients in a hospital or residential care setting.

Examples of biological response modifiers are agents that modify defense mechanisms of living organisms or biological responses, such as survival, growth, or differentiation of tissue cells to direct them to have anti-tumor activity. Such agents include, but are not limited to, krestin, lentinan, sizofuran, picibanil, PF-3512676 and ubenimex.

Examples of pyrimidine analogs include, but are not limited to, 5-fluorouracil, floxuridine, doxifluridine, raltitrexed, cytarabine, cytosine arabinoside, fludarabine, triacetyluridine, troxacicabine and gemcitabine.

Examples of purine analogs include, but are not limited to, mercaptopurine and thioguanine.

Examples of antimitotic agents include, but are not limited to, N-(2-((4-hydroxyphenyl)amino)pyridin-3-yl)-4-methoxybenzenesulfonamide, paclitaxel, docetaxel, larotaxel, epothilone D, PNU-100940, batabulin, ixabepilone, patupilone, XRP-9881, vinflunine and ZK-EPO (synthetic epothilone).

Examples of radiotherapy include, but are not limited to, external beam radiotherapy (XBRT), teletherapy, brachytherapy, sealed-source radiotherapy and unsealed-source radiotherapy.

BiTE antibodies are bi-specific antibodies that direct T-cells to attack cancer cells by simultaneously binding the two cells. The T-cell then attacks the target cancer cell. Examples of BiTE antibodies include, but are not limited to, adecatumumab (Micromet MT201), blinatumomab (Micromet MT103) and the like. Without being limited by theory, one of the mechanisms by which T-cells elicit apoptosis of the target cancer cell is by exocytosis of cytolytic granule components, which include perforin and granzyme B. In this regard, Bcl-2 has been shown to attenuate the induction of apoptosis by both perforin and granzyme B. These data suggest that inhibition of Bcl-2 could enhance the cytotoxic effects elicited by T-cells when targeted to cancer cells (Sutton et al. (1997) *J. Immunol.* 158:5783-5790).

SiRNAs are molecules having endogenous RNA bases or chemically modified nucleotides. The modifications do not abolish cellular activity, but rather impart increased stability and/or increased cellular potency. Examples of chemical modifications include phosphorothioate groups, 2'-deoxy-nucleotide, 2'-OCH<sub>3</sub>-containing ribonucleotides, 2'-F-ribonucleotides, 2'-methoxyethyl ribonucleotides, combinations thereof and the like. The siRNA can have varying lengths (e.g., 10-200 bps) and structures (e.g., hairpins, single/double strands, bulges, nicks/gaps, mismatches) and are processed in cells to provide active gene silencing. A double-stranded siRNA (dsRNA) can have the same number of nucleotides on each strand (blunt ends) or asymmetric ends (overhangs). The overhang of 1-2 nucleotides can be present on the sense and/or the antisense strand, as well as present on the 5'- and/or the 3'-ends of a given strand. For example, siRNAs targeting Mcl-1 have been shown to enhance the activity of the apoptosis-promoting agent ABT-263 (Tse et al. (2008) *Cancer Res.* 68:3421-3428 and references therein).

Multivalent binding proteins are binding proteins comprising two or more antigen binding sites. Multivalent binding proteins are engineered to have the three or more antigen binding sites and are generally not naturally occurring antibodies. The term "multispecific binding protein" means a binding protein capable of binding two or more related or unrelated targets. Dual variable domain (DVD) binding proteins are tetravalent or multivalent binding proteins binding proteins comprising two or more antigen binding sites. Such DVDs may be monospecific (i.e., capable of binding one antigen) or multispecific (i.e., capable of binding two or more antigens). DVD binding proteins comprising two heavy-chain DVD polypeptides and two light-chain DVD polypeptides are referred to as DVD Ig's. Each half of a DVD Ig comprises a heavy-chain DVD polypeptide, a light-chain DVD polypeptide, and two antigen binding sites. Each binding site comprises a heavy-chain variable domain and a light-chain variable domain with a total of 6 CDRs involved in antigen binding per antigen binding site.

PARP inhibitors include, but are not limited to, ABT-888, olaparib, KU-59436, AZD-2281, AG-014699, BSI-201, BGP-15, INO-1001, ONO-2231 and the like.

40 The present invention also provides a method for maintaining in bloodstream of a human cancer patient a therapeutically effective plasma concentration of Compound 1 and/or one or more metabolites thereof, comprising administering to the subject a pharmaceutical composition as described herein, in a dosage amount equivalent to about 50 to about 500 mg Compound 1 per day, at an average dosage interval of about 3 hours to about 7 days.

45 What constitutes a therapeutically effective plasma concentration depends inter alia on the particular cancer present in the patient, the stage, severity and aggressiveness of the cancer, and the outcome sought (e.g., stabilization, reduction in tumor growth, tumor shrinkage, reduced risk of metastasis, etc.). It is strongly preferred that, while the plasma concentration is sufficient to provide benefit in terms of treating the 50 cancer, it should not be sufficient to provoke an adverse side-effect to an unacceptable or intolerable degree.

55 For treatment of cancer in general and of a lymphoid malignancy such as non-Hodgkin's lymphoma in particular, the plasma concentration of Compound 1 should in most cases be maintained in a range of about 0.5 to about 10  $\mu\text{g}/\text{ml}$ . Thus, during a course of Compound 1 therapy, the steady-state  $C_{\max}$  should in general not exceed about 10  $\mu\text{g}/\text{ml}$ , and the steady-state  $C_{\min}$  should in general not fall below about 0.5  $\mu\text{g}/\text{ml}$ . It will further be found desirable to select, within the ranges 60 provided above, a daily dosage amount and average dosage interval effective to provide a  $C_{\max}/C_{\min}$  ratio not greater than about 5, for example not greater than about 3, at steady-state.

## US 8,722,657 B2

**39**

It will be understood that longer dosage intervals will tend to result in greater  $C_{max}/C_{min}$  ratios. Illustratively, at steady-state, an Compound 1  $C_{max}$  of about 3 to about 8  $\mu\text{g}/\text{ml}$  and  $C_{min}$  of about 1 to about 5  $\mu\text{g}/\text{ml}$  can be targeted by the present method.

A daily dosage amount effective to maintain a therapeutically effective Compound 1 plasma level is, according to the present embodiment, about 50 to about 1000 mg. In most cases a suitable daily dosage amount is about 200 to about 400 mg. Illustratively, the daily dosage amount can be for example about 50, about 100, about 150, about 200, about 250, about 300, about 350, about 400, about 450, about 500, about 750 or about 1000 mg.

An average dosage interval effective to maintain a therapeutically effective Compound 1 plasma level is, according to the present embodiment, about 3 hours to about 7 days. In most cases, a suitable average dosage interval is about 8 hours to about 3 days, or about 12 hours to about 2 days. A once-daily (q.d.) administration regimen is often suitable.

As in other embodiments, administration according to the present embodiment can be with or without food, i.e., in a non-fasting or fasting condition. It is generally preferred to administer the present compositions to a non-fasting patient.
